List of Valid Qualifiers
May 29, 2014

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
CT1	The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, H1	Not detected; Sample analysis performed past holding time.
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
TNTC, B	Too numerous to count. Analyte present in method blank.
U	Analyte was not detected. The concentration is below the reported LOD.
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)

NELAP Addendum - May 22, 2014

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVL NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Thiodiglycol (TDG-LCMS)
Acetate (HPLC-UV)
Formate (HPLC-UV)
Acetaldehyde (HPLC-UV)
Propionaldehyde (HPLC-UV)
Fluoroborate (ISE)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVL MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam

Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL MSV0I/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVL RSKOI/GC-FID

Isobutane
n-Butane
Propane
Propylene
Propyne

OVL HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

SOLID AND HAZARDOUS CHEMICALS

OVL MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVL MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

APPENDIX E: CORRELATION DOCUMENTATION

Correlation Coefficient Evaluation

Evaluation of correlation between groundwater elevations and COC concentrations.

67WW08

Contaminant	6/3/2013	10/2/2013	1/23/2014	5/7/2014	Correlation Coefficient *
1,1,2-trichloroethane	4.25	5.08	6.7	5.01	-18.0%
1,1-dichloroethene	940	1120	1340	1590	65.1%
1,2-dichloroethane	89.2	76.5	89.9	101	97.4%

Re: Cessation of Perimeter Well Sampling Requirement of the December 2, 1999 Dispute Resolution, Longhorn Army Ammunition Plant, Karnack, Texas

Dear Ms. Palmie,

A decision was made by the FFA representatives on January 31, 2017 regarding the perimeter well sampling that has been taking place as a requirement of the 1999 Unanimous Decision of the Dispute Resolution Committee. We agreed that it should be discontinued and you provided an email confirmation of that decision, attached here for the record.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler

Subject: [Non-DoD Source] RE: EPA Approval of the September 2016 Groundwater Sampling Results at Longhorn AAP Site 003-R (Ground Signal Test Area)

Good Afternoon JoLynn/Rose, I've reviewed the September 2016 Groundwater Sampling Results at Longhorn Site 003-R (Ground Signal Test Area) and have no comments and thereby approve the February 2017 Memo. Thanks.

MEMORANDUM FOR RECORD

February 8, 2017

SUBJECT: Groundwater Sampling Methodology and Perchlorate Analytical Results for September 2016, LHAAP-003-R (Ground Signal Test Area), at Longhorn Army Ammunition Plant, Karnack, Texas

This memorandum presents the methodology and analytical results for the groundwater sampling event conducted at LHAAP-003-R on September 28 and 29, 2016. The purpose of the groundwater sampling and analysis is to confirm that the levels of perchlorate in groundwater are protective of human health at concentrations below the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) which is the state remedial standard utilized in the absence of a federal drinking water standard. The PCL is 17 micrograms per liter (µg/L) for perchlorate. The three groundwater monitoring wells sampled at LHAAP-003-R (MW-127, MW-128, and 18WW16) are screened in the Shallow Zone. Refer to **Figure 1** for sampling locations. The sampling rationale and methodology followed the procedures documented in the Installation-Wide Work Plan (IWWP) (AECOM, 2014). Sampling for perchlorate was conducted based on the requirements of the Final Record of Decision (ROD) LHAAP-001-R (South Test Area/Bomb Test Area) and LHAAP-003-R (Ground Signal Test Area) (Shaw, 2016).

The LHAAP-003-R site served as a site of former aerial and on-ground testing and destruction of a variety of explosive devices as well as testing and burn-out of rocket motors. Perchlorate was identified as an emerging contaminant, and perchlorate data for environmental media were collected after the 1998 No Further Action (NFA) Record of Decision (ROD) was signed (Shaw, 2016). Between May 2000 and February 2001, during three consecutive quarterly sampling events, groundwater samples were collected from three existing shallow monitoring wells to determine whether perchlorate contamination had occurred as a result of past historical activities (STEP, 2005). Perchlorate only exceeded the TRRP Tier 1 Groundwater Residential PCL (17 µg/L) in the first quarter (April and May 2000) groundwater samples collected from MW-127, MW-128, and 18WW16. Perchlorate concentrations were below detection limits in the three monitoring wells during the second quarter (August through October 2000). During the third quarter, (January and February 2001), perchlorate was detected only in the groundwater sample collected from well 18WW16 at a concentration of 8 µg/L, below the TRRP Tier 1 Groundwater Residential PCL. No perchlorate was detected in the shallow groundwater samples from wells MW-127 and MW-128 (Shaw, 2016).

In October, 2009, the U.S. Environmental Protection Agency (USEPA) collected additional samples from four existing monitoring wells (MW-127, MW-128, 18WW16, and 18WW01) to confirm groundwater conditions at the site. Perchlorate was detected in only one well at a

concentration that was below the TRRP Tier 1 Groundwater Residential PCL. The Army collected split samples at the same time USEPA collected its samples from the four wells. Perchlorate was detected in the Army split sample from one of the wells (18WW16), but the concentration was below the TRRP Tier 1 Groundwater Residential PCL of 17 µg/L (Shaw, 2016).

On September 28 and 29, 2016 groundwater samples were collected from Shallow Zone monitoring wells MW-127, MW-128, and 18WW16 and analyzed for perchlorate, using EPA Method SW 6850. Prior to collecting the samples, monitoring wells MW-127 and MW-128 were re-developed (development forms are provided in **Appendix A)**. Monitoring well 18WW16 did not need to be re-developed, because it is sampled regularly with LHAAP-18/24.

Groundwater samples were collected utilizing low-flow sampling techniques for MW-127 and MW-128. Monitoring well 18WW16 was bailed dry and sampled the next day with a bailer. Prior to sampling, the depth to groundwater and total depth of each monitoring well were measured using a Solinst Model 101 water level meter. For MW-127 and MW-128, a bladder pump was lowered into the well and placed within the screened interval, then pumped at a rate of approximately 100 milliliters per minute (mL/min). The groundwater was pumped through a flow-through cell where field parameters including temperature, pH, conductivity, oxygen reduction potential (ORP), dissolved oxygen (DO), and turbidity were measured using a U-52 Horiba water quality meter. After the groundwater parameters stabilized within the ranges specified in the IWWP (AECOM, 2014), each groundwater sample was collected in a 250-mL clear plastic bottle. The bottles were labelled and placed in coolers containing ice for temporary storage and shipment to the Microbac laboratory located in Marietta, Ohio following Chain-of-Custody procedures. **Appendix A** provides the field sampling forms.

Quality control (QC) samples, including a field duplicate, matrix spike (MS), and matrix spike duplicate (MSD), were collected as prescribed in the IWWP (AECOM, 2014) to assess the precision, accuracy, and representativeness of the analytical results.

The groundwater samples were analyzed within the maximum holding time for Method SW 6850. Analytical data received from Microbac were validated in accordance with quality assurance/quality control (QA/QC) requirements for this project and were determined to be usable for their intended purpose. The data validation information is summarized in the Quality Control Summary Report (QCSR) presented in **Appendix B**. **Appendix C** provides the laboratory reports for the groundwater samples.

In September 2016, perchlorate was detected in 18WW16 (5.32 µg/L) and was not detected in the samples collected from MW-127 and MW-128. The detected perchlorate concentration is below the TRRP Tier 1 Groundwater Residential PCL of 17 µg/L. The groundwater analytical results for perchlorate for September 2016 are presented in **Table 1.**

Historical and recent (September 2016) analytical results for perchlorate in shallow groundwater at LHAAP-003-R indicate perchlorate does not pose an unacceptable risk to human health and the environment. Per the ROD, if, after one round of groundwater sampling at LHAAP-003-R, the results that are evaluated on or before the first five year review indicate detections at levels below the TRRP Tier 1 Groundwater Residential PCL value of 17 µg/L for perchlorate, groundwater monitoring will cease and the wells will be plugged and abandoned. The September 2016 groundwater samples meet this criterion, therefore, groundwater monitoring at LHAAP-003-R will cease and the wells will be plugged and abandoned (with the exception of 18WW16 which is sampled regularly with LHAAP-18/24).

1 INTRODUCTION

AECOM reviewed one data package from Microbac Laboratory Services, Marietta, OH. Groundwater samples were collected on September 28 and 29, 2016 at Longhorn Army Ammunition Plant (LHAAP), Karnack, Texas. Data were reviewed for conformance to the requirements of the following guidance documents: Automated Data Review by Laboratory Data Consultants (ADR.net), United States Environmental Protection Agency (EPA) Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, (EPA, July 2002), and EPA Contract Laboratory Program National Functional Guidelines for Low Concentration Organic Data Review, (EPA, June 2001).

1.1 Intended Use of Data

The purpose of the groundwater sampling and analysis is to determine the presence or absence of perchlorate at concentrations above the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL). Analyses requested included:

- SW6850 – Perchlorates by LC/MS/MS

Table 2 lists the sample identifications and their associated laboratory identifications.

1.2 Preservation and Holding Times

Sample identification data were evaluated for agreement with the chain-of-custody (COC). All samples were received in appropriate containers, within the proper temperature range, in good condition, and with the required signatures.

1.3 Calibrations

Initial calibration criteria modification includes RSD< or = to 30%, two compounds allowed up to 40%. If the continuing calibration verification (CCV) compound exceeds 30% drift, the compound is checked in the LCS, if both are outside recovery limits, the compound is rejected, R. If only the CCV exceeds recovery criteria and is less than ± 40% drift, then the compound is qualified J or UJ.

1.3.1 Continuing Calibration Verifications (CCV)

All CCVs were within control limits.

1.3.2 Blanks

Where contamination by a target analyte of one of the various blanks was found, if the sample result for an associated sample was non-detect or less than 5X (10X for common laboratory contaminants) the analyte concentration in the blank, the corresponding sample result for the analyte was qualified B. Where the sample result for the affected analyte was greater than 5X the amount in the blank, no qualifier was applied.

No blank contamination was found.

1.3.3 Surrogates

All surrogates were within control limits.

1.3.4 Laboratory Control Sample (LCS)

All LCS were within control limits.

1.3.5 Matrix Spike/ Matrix Spike Duplicate (MS/MSD)

The MS/MSD was within control limits.

1.3.6 Field Duplicate Precision

The field duplicate was within control limits.

2 DATA USABILITY SUMMARY

The data are usable for the intended purposes of the project. The data quality objectives have been met for the project.

Table 1: Completeness by Method

Method	Total Analytes	No. of Rejected Results	% Completeness

Appendix C: LHAAP-003-R Analytical Reports – September 2016

Microbac

Laboratory Report Number: L16091386

Kayla Teague
AECOM Technical Services, Inc.
1950 N Stemmons FWY
Dallas, TX 75207

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Adriane Steed – Client Services Specialist
(740) 373-4071
Adriane.Steed@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on October 13 2016

Leslie Bucina – Managing Director

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
00114100	I	2.0		J4616883291	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	All samples were checked for pH and met the standard. Exceptions are noted above under discrepancy. (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	Yes
12	Were VOA samples free of headspace (less than 6mm)?	NA

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L16091386
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG586928	**Reviewer Name:**	Eric Lawson
LRC Date:	2016-10-13 00:00:00		

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?			X		
Were % moisture (or solids) reported for all soil and sediment samples?			X		
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L16091386
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG586928	**Reviewer Name:**	Eric Lawson
LRC Date:	2016-10-13 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?			X		
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L16091386
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG586928	**Reviewer Name:**	Eric Lawson
LRC Date:	2016-10-13 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L16091386
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG586928	**Reviewer Name:**	Eric Lawson
LRC Date:	2016-10-13 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L16091386

LRC Date:	2016-10-13 00:00:00		

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

There are no exceptions.

2.1.1.2 QC Summary Data

Example Calculation 6850 - Perchlorate

Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of internal standard (IS) = Rx/Ristd

x = amount ratio = concentration analyte/concentration internal standard (IS) = Cx / Cistd

m = slope from curve (1.45)

b = intercept from curve (-0.00242)

y = 1.45x + -0.00242

Step 2: Substitute the value for y

where y = 12600/226000 = 0.055752

Step 3: Solve for x

x = (y - b)/m = 0.0040119

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(x) = (5 ug/L)(0.040119) = 0.200594 ug/L

Example Calculation - Water:

Slope from curve, m:	1.45
Intercept from curve, b:	-0.00242
Response of analyte, Rx:	12600
Response of Internal Standard , Ristd:	226000
Concentration of IS, Cistd (ug/L):	5.00
Response Ratio:	0.05575
Amount Ratio:	0.04012
Analyte Concentration, Cx (ug/L) :	0.200594

Example Calculation - Soil:

Analyte Concentration, Cx (ug/L):	0.20059
Amount of soil extracted (g):	5.00
Final volume of extract (mL):	50.00
Percent solids (Pct wt.)	100
Concentration in soil (ug/kg):	2.005938

Perchlorate Conductivity Check
(perchlorate1)

Comments

Seq.	Rerun	Dil.	Reason	Analytes
17				
	L16041363-08 MS : The MS %Rec is 129%. This is above the advisory limit of 120%. The parent sample to this MS had responses that passed the ion-ratio criteria, but had a quantified value below the method's detection limit, resulting in an assigned value of zero. If the quantified value for the parent sample were used in the %Rec calculation, the MS %Rec would be 93.9%.			
18				
	L16041363-09 MSD : The MSD %Rec is 131%. This is above the advisory limit of 120%. The parent sample to this MSD had responses that passed the ion-ratio criteria, but had a quantified value below the method's detection limit, resulting in an assigned value of zero. If the quantified value for the parent sample were used in the %Rec calculation, the MSD %Rec would be 95.4%.

List of Valid Qualifiers
October 13, 2016

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
>,H1	Result is greater than the associated numerical value. Sample analysis performed past holding time.
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B,H1	Analyte present in method blank. Sample analysis performed past holding time.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
CT1	Cooler temperature at sample reciept exceeded regulatory limit.
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
E,CT1	Estimated results. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
FP1	Did not ignite.
H1	Sample analysis performed past holding time.
H1,CT1	Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guidelines for reque
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value ; the analyte concentration was less than the LOQ. Cooler temperature at sample reciept exceeded regu
J,H1	Estimated value ; the analyte concentration was less than the LOQ. Sample analysis performed past holding time.
J,H1	The reported result is an estimated value. Sample was analyzed past holding time.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL)
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
ND,H1	Not detected; Sample analysis performed past holding time.
ND,H1,CT1	Not detected; Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guide
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
Q,H1	One or more quality control criteria failed. Sample analyzed past holding time. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
T5	Laboratory not licensed for this parameter
TIC	Library Search Compound

Microbac Laboratories Inc.
List of Valid Qualifiers

Qualkey: DOD

TNTC	Too numerous to count
TNTC, B	Too numerous to count. Analyte present in method blank.
TNTC,CT1	Too numerous to count. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
TNTC,H1	Too numerous to count. Sample analysis performed past holding time.
U	Analyte was not detected. The concentration is below the reported LOD.
U,CT1	Analyte was not detected. The concentration is below the reported LOD. Cooler temperature at sample reciept exceeded
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - January 4, 2016

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVD NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Propionaldehyde (HPLC-UV)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1
ASTM D3987-06

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVD MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam
Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD MSV01/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVD HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

OVD HPLC12/HPLC/UV

Acetate
Formate

OVD RSK01/GC-FID

Acetylene
Propane

OVD K9305/ISE

Fluoroborate

SOLID AND HAZARDOUS CHEMICALS

OVD MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVD MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

Re: Draft Final 2nd Annual Remedial Action Operation Report for LHAAP-67, Above Ground Storage Tank Farm at Longhorn Army Ammunition Plant, Karnack, Texas

Dear Mr. Mayer,

The above-referenced document is being transmitted to you for your records and includes revisions based upon your comments on the Draft. In accordance with the FFA, the Draft Final will be considered Final after 30 days without further comment.

The document was prepared by AECOM on behalf of the Army as part of AECOM's Performance Based Remediation contract for the facility. I ask that Debra Richmann, AECOM's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

Copies furnished:

Responses to Comments on
Draft 2nd Annual Remedial Action Operation Report for Site LHAAP-67 (Above Ground Storage Tank Farm)
Longhorn Army Ammunition Plant, Karnack, Texas

November 2016

Reviewer: Richard Mayer, EPA

Respondent: Debra Richmann, AECOM

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1	iii	Minor Editorial Comment	Please move micrograms per liter at the top of the page to the location of "milligrams per liter", so that the abbreviations are in alphabetical order. Also, please remove RD, since it is not used in the text.	C	Concur. "µg/L -micrograms per liter" has been moved as requested. The acronym RD occurs on page 2-3. However, it does not occur anywhere else in the report, so it has been removed from the list of acronyms and abbreviations and deleted from the only place it occurred in the text (Section 2.2.2).	
2	1-2	End of Full Paragraph	Please add Shaw, 2011 reference to the reference list.	D	The Shaw, 2011 reference is included in the references list on page 5-1 of the draft report.	
3		Figure 2-2	The flow direction at this site is consistently changing over the various quarters due to several factors that include dry wells, anomalous data, weather events, and changes in the network of wells. Hopefully, over time and the inclusion of new wells (and additional data) a consistent flow direction will be determined.	C	Noted. Please see response to comment 5.	
4		Figure 2-7	The monitoring well groundwater elevations are not shown on the figure, please include them.	E	It is assumed this comment refers to Figure 2-6. Figure 2-6 was modified from Figure 2-4 in the Final Remedial Design (Shaw, 2011), which shows the groundwater surface elevation contours, based on December 2007 measurements. However, that source figure does not include the groundwater surface elevations for the individual wells. Please note that in response to a TCEQ comment, Figure 2-6 has been re-named "Historical Shallow Zone Groundwater Gradient".

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
5		Table 2-3, Well 67WW02	What is perplexing is that this well had no detections for 1,1-DCE since December of 1998 (9 sampling events over 17 years) and then had a detection in February of 2015 (3.59 ug/l) and then in May of 2015 had a concentration above the MCL of 13.2 ug/l. What is even stranger is that the sampling event in May of 2016 had 1,1-DCE at 67.6 ug/l (this is not in the report, found in the June 2016 validated data). Is there an explanation for this?	--	The groundwater surface at the site is relatively flat, so even slight variations in measured groundwater levels can result in widely varying groundwater flow interpretations, based on contouring the elevations for each well. In 2007 the interpreted groundwater flow was to the north west (Figure 2-6). In the Year 1 RA-O (May 2013 – May 2014) report, the interpreted groundwater flow directions were predominantly to the north/northeast, away from 67WW02 in May 2013, September 2013, and January 2014. Then in May 2014, the flow direction shifted and became predominantly to the north/northwest, toward 67MW02. This remained the predominant direction of groundwater flow throughout Year 2. However, as noted in the comment, 1,1-DCE was not detected at 67MW02 until February 2015. Even so, the change in groundwater flow direction appears to be the main factor influencing the appearance and observed increasing concentrations of 1,1-DCE in monitoring well 67WW02.	
6		Table 2-3, Well 67WW14	Also interesting (although not as unique as well 67WW02), is that since October of 2013, 1,1-DCE was below the MCL for seven consecutive sampling events until May 2016 where the concentration was 10.8 ug/l (the result is from the June 2016 validated data).	--	Noted.	
7		Table 2-3, Well 67WW09	The good news is that the last two monitoring events (including the May 2016 sampling event) the concentrations of 1,1-DCE have been below the MCL.	--	Noted.	
8	3-5	Last Paragraph	Please include a table or appendix with the calculations discussed in this paragraph.	C	The supporting documentation for the correlation coefficients are provided in Appendix F.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1	2-2	Section 2.2.1	Second bullet I compared Table 2-1 to the same table in Year 1 report. I don't see any difference in the screened intervals for 67WW01-03.	E	Table 2-1 in both the Year 1 and Year 2 reports is the same, because both tables include the results of a downhole camera survey performed in March 2015 to resolve some well construction uncertainties. Specifically, Table 2-1 reflects the top and bottom depths/elevations of the screens in wells 67WW01, -02, and -03 as confirmed by the downhole survey. . A new footnote "c" has been added to Table 2-1 to clarify the source of the information used to determine these screen intervals. The text in the second bullet on page 2-2 has been revised for clarification.	
2	2-3	Section 2.3	Second paragraph could also note that plume is delineated within the LUC boundary and not near surface water body.	C	The following text has been added before the last sentence in the second paragraph: "Further, the VOC plume is delineated within the LUC boundary and is not near any surface water body."	
3		Figures 2-2 through 2-6	The groundwater gradient is pretty flat at this site with generally less than 1 foot change across the site. There really are not enough data points to justify the o.1 and 0.2 foot contours and the extra lines really don't add information. Such small variations could be related to well development, screening, or smearing. I request again that we not contour more often than every 0.5 foot. The contours should be at XXX.0 and XXX.5. 2-6 – Has no elevations. Change title to add "Historic Groundwater Gradient" or similar.	C/D	Because of the very low relief and number of control points at the site, re-contouring the potentiometric surface figures at a 0.5 ft contour interval would not add any value (only one or possibly two contour lines would be shown per figure). The title on Figure 2-6 has been changed to, "Historical Shallow Zone Groundwater Gradient Map", because AECOM Figure 2-6 was modified from Figure 2-4 in the Final Remedial Design (Shaw, 2011), which did not include groundwater elevations for the individual wells.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
4	3-2	Section 3.1	Well 67WW02 – agree new boundary well will be necessary if trend continues. Well 67WW03 – the absence of COCs is not likely from natural attenuation. This well is screened higher than the wells that produce water and contain site COCs. Please revise assertion.	C	The text concerning the COCs reported in 67WW03 in 1998 has been changed to indicate the initially reported concentrations are suspect and/or not representative of the shallow zone groundwater. The second to last sentence has been modified as follows: "Because this well has been chronically dry, it was replaced by adjacent well 67WW12, which is screened over an interval that is approximately 10 feet deeper than well 67WW03."	
5	4-2	Section 4	Agree with conclusion that MNA biodegradation does not appear to be occurring. Also agree that with shift in groundwater gradient, plume appears less stable at northern boundary.	--	Noted.

1 INTRODUCTION

The United States (U.S.) Army Corps of Engineers (USACE), Tulsa District, contracted AECOM Technical Services, Inc. (AECOM), to perform remedial activities at multiple sites at the former Longhorn Army Ammunition Plant (LHAAP), Karnack, Texas, under the Huntsville District's Worldwide Environmental Restoration Services Contract Number (No.) W912DY-09-D-0059, Task Order No. DS01. As part of this contract, AECOM is performing groundwater and surface water monitoring as part of Remedial Action Operations (RA(O)) for the Monitored Natural Attenuation (MNA) groundwater remedy at site LHAAP-67. A Final Record of Decision (ROD) was executed for LHAAP-67 in June 2010 (USACE, 2010). Groundwater monitoring at LHAAP-67 is ongoing as described in the Draft Final Remedial Action Completion Report (RACR) (AECOM, 2015). This RA(O) report represents the second year of RA(O) implementation and summarizes the results of site inspections and sampling activities completed between July 2014 and May 2015. A draft first year RA(O) report which covers the period between May 2013 and May 2014 was prepared in March 2015. This report encompasses and provides analysis for two years of MNA data.

LHAAP is located in east-central Texas in the northeastern corner of Harrison County between State Highway 43 in Karnack, Texas, and the western shore of Caddo Lake (see **Figure 1-1**). The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the east. Caddo Lake is a large freshwater lake that bounds LHAAP to the north and east. The eastern fence of the LHAAP installation is 3.5 miles from the Texas-Louisiana state border.

1.1 Remedial Action Objectives

The Remedial Action Objectives (RAOs) at the LHAAP-67 site must protect human health and meet applicable or relevant and appropriate requirements. There are no ecological risks at the LHAAP-67 site (USACE, 2010).

The RAOs for the LHAAP-67 site, consistent with the reasonably anticipated future use as a national wildlife refuge, are:

- Protection of human health by preventing human exposure to the contaminated groundwater;
- Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water; and,
- Return of groundwater to its potential beneficial use as drinking water, wherever practicable.

1.2 Performance Objectives

The remedy selected for LHAAP-67 is Land Use Control (LUC) and MNA. The performance objectives at LHAAP-67 consist of two components: physical inspections and groundwater/surface water monitoring. As a component of the LUC implementation, the civil survey of the LUC boundary was conducted in November 2014 and recorded in the Harrison County Courthouse in December 2014. Physical inspections are conducted periodically to confirm compliance with the LUC objectives, which consist of preventing human exposure to

groundwater contamination presenting an unacceptable risk to a future maintenance worker and ensuring that there is no withdrawal or use of groundwater from the site for anything other than environmental monitoring and testing until the cleanup levels are attained. Groundwater monitoring has been in-progress at the site since May 2013, and LHAAP-67 will also have Five-Year Reviews completed as part of the site wide Longhorn Five-Year Review.

According to the Remedial Design (Shaw, 2011), groundwater monitoring is being performed to demonstrate that natural attenuation is an effective remedy that will attain the remediation objectives over time and that the groundwater plume will not migrate to nearby surface water bodies at levels that may present an unacceptable risk to human health and the environment. Groundwater monitoring is being performed in accordance with the Remedial Action Work Plan (RAWP) (AECOM, 2013) to:

- detect changes in environmental conditions that may reduce the efficacy of natural attenuation processes,
- identify potentially toxic and/or mobile transformation products,
- verify that the plume is not expanding and poses no unacceptable risk to downgradient receptors,
- detect new releases of contaminants to the environment that could impact effectiveness of the natural attenuation remedy, and
- verify attainment of the remediation objectives.

Work completed as part of the 2014/2015 RA(O) consisted of four quarterly groundwater sampling events at fifteen wells. This report summarizes the LUC compliance inspection, results of groundwater sampling, and an evaluation of MNA.

1.3 Site Description

LHAAP-67 is in the central portion of LHAAP, on the southeast corner of 48th Street and Ignatus Avenue (see **Figure 1-2**), and covers an area of approximately 1.9 acres. The site topography is relatively flat. The nearest significant surface water body is Central Creek located approximately 870 feet southeast of LHAAP-67. Central Creek eventually flows into Caddo Lake.

When operational, LHAAP-67 consisted of seven above ground storage tanks (ASTs) used for storing No. 2 fuel oil, kerosene, and solvents. The size of the tanks is unknown. The tanks were surrounded by earthen dikes designed to contain potential spills. The ASTs have been removed and the only structure remaining at the site is a railroad bed.

The LUC area associated with the groundwater use restriction at LHAAP-67 extends beyond the historical site boundaries along the western, eastern and southern sections of the site, and encompasses a total of 2.6 acres. LHAAP-67 has no known areas of archaeological or historical importance.

1.4 Conceptual Site Model

A detailed Conceptual Site Model of LHAAP-67 was previously presented in the ROD (USACE, 2010). Based upon additional data collected as part of final remedy implementation as presented

in the LHAAP-67 Draft Final RACR (AECOM, 2015), the lithologic units at the site have been reclassified.

Historically, two distinct water-bearing zones (shallow and intermediate) had been designated at LHAAP-67; however, during drilling performed for the 2013 investigation, no continuous clay layer (aquitard) or significant lithological differences between previously identified shallow and intermediate zones were encountered. Co-located monitoring wells 67WW06 (total depth 49.83 feet below ground surface) and 67WW07 (total depth 27.86 feet below ground surface), historically identified as intermediate and shallow zone wells, respectively, had similar static water levels during the four sampling events performed during 2013/2014, with a maximum difference of 1.04 ft noted during the January 2014 event (these small differences were confirmed in the four 2014/2015 sampling events with a maximum difference of 0.08 feet). Therefore, the previously designated shallow and intermediate zones are now considered to be hydraulically connected and constitute a single uppermost groundwater-bearing unit at LHAAP-67 to a depth of approximately 50 feet below ground surface. Monitoring well 67WW06, which was previously identified as an intermediate zone well, is now re-classified as a shallow zone monitoring well, screened in the uppermost groundwater-bearing unit.

A deeper "intermediate" water-bearing zone was; however, identified at a depth of approximately 68 feet below ground surface in boring 67DPT14 (drilled in June 2014) with a clear aquitard separating this unit from the shallow zone.

Based on this information, shallow and intermediate water-bearing zones are present in the LHAAP-67 investigation area, but the configuration has been modified from that presented in the remedial design as discussed above.

The contaminants of concern (COCs) identified in LHAAP-67 shallow zone groundwater are trichloroethene (TCE), 1,1-dichloroethene (1,1-DCE), 1,2-dichloroethane (1,2-DCA), 1,1,1-trichloroethane (1,1,1-TCA), and 1,1,2-trichloroethane (1,1,2-TCA). The presence of these COCs in the shallow groundwater zone represents the primary driver for remedial action as they are at concentrations above the human health standard for future maintenance worker under an industrial exposure scenario. There are no ecological risks at the LHAAP-67 site.

The nature and extent of groundwater contamination at LHAAP-67 was evaluated during field investigations conducted between 1998 and 2007. It is believed that historic releases from the ASTs at the site contaminated the soil, with contaminants then leaching from the soil into groundwater. A relatively small area of contamination is observed in the shallow groundwater which poses an unacceptable carcinogenic risk and non-carcinogenic hazard to a hypothetical future maintenance worker under an industrial exposure scenario. There is no groundwater contamination in the deeper "intermediate" groundwater zone. The only potentially complete exposure pathway is via use of shallow-zone groundwater as drinking water. However, shallow groundwater is not used as drinking water at the refuge and the pathway is eliminated from any hypothetical receptor because land use controls are in place that prohibits the use of groundwater other than for environmental monitoring and testing. The nearest significant surface water body to LHAAP-67 site is Central Creek, located upgradient and approximately 870 feet from the site. There is no other surface water body in close proximity to the LHAAP-67 site. Therefore, there is no demonstrated complete pathway from groundwater to surface water.

Based on groundwater level data collected in 2014/2015, the dominant shallow zone groundwater gradient appears to be to the north/northwest. The gradient is based on data collected from up to 15 monitoring wells. The previous RA(O), March 2015 report, revealed that the dominant shallow zone groundwater gradient appeared to be to the north/northeast although the flow direction began to shift direction by May 2014 towards the north/northwest and continued to show a north/northwesterly flow direction for the entire second year RA(O) reporting period. The apparent change of the shallow zone groundwater gradient may be due to the increase in precipitation the area received during the current monitoring period (2014/2015) and particularly in 2015. The historical gradient was assumed to be to the southeast (Final Remedial Design, August 2011) which was based on data collected primarily from three (3) monitoring wells because some of the wells such as 67WW03 and 67WW04 were dry most of the time. This reinterpretation of the gradient was a result of installation of additional monitoring wells which provided a better definition of the groundwater gradient. Therefore, potential discharge to surface water in Central Creek became an incomplete exposure pathway and surface water sampling as stated in the RAWP was no longer necessary.

A temporary well installed in soil boring 67DPT14 was completed in the deeper “intermediate” water-bearing zone to a depth of 78 feet below ground surface. Groundwater analyzed from 67DPT14 revealed that no COCs were identified. Therefore, the contaminants are confined to the shallow zone groundwater.

2 SITE ACTIVITIES AT LHAAP-67

2.1 Annual LUC Compliance Inspection, Monitoring, and Repairs

AECOM performed the annual LUC compliance inspection for LHAAP-67 site on July 10, 2014 and again on July 21, 2015. The Annual LUC Compliance Certification Documentation Form for the second year RA(O) period is included in **Appendix A**. No non-compliance issues or concerns were noted during the annual inspection.

No damage to bollards, pads, or protective casings was observed and minimal encroachment of weeds or brush on the well pads was observed. Monitoring well identification tag replacement, as well as painting/re-labeling as needed, for wells outside the current monitoring network was completed in Fall 2013. Monitoring well 67WW05 was observed to be needing paint. Therefore, the old paint was scraped and a new coat of paint was applied to the well casing and the bollards. A photo documenting the condition of the well after completing the work is shown on **Appendix B**. The work was completed on September 4, 2015. Area mowing and clearing around the wells is conducted on an as needed basis but typically done before sampling events.

2.2 Groundwater Monitoring

For the 2nd year RA(O), four quarterly groundwater sampling events of 15 monitoring wells were completed in July 2014, December 2014, February 2015, and May 2015. The monitoring wells are depicted in **Figure 2-1** and listed in **Table 2-1**. The groundwater in each of the 15 wells was gauged; if sufficient water existed in the well each well was sampled. Groundwater was not sampled from 67WW06 due to its proximity to 67WW07. Groundwater was not detected in 67WW04, and was detected and sampled only in May 2015 in 67WW03.

Before collecting groundwater samples, the wells were gauged using a water level probe and the depth to water recorded to the neared 0.01 foot from the top of casing. Water samples were collected using the low-flow sampling technique as described in the Groundwater Sampling Procedures found in the Installation-Wide Work Plan (AECOM, 2014). The objective of using this method was to collect representative samples of the groundwater in the formation adjacent to the well screen, eliminating the mixing of stagnant water above and below the well screen. After water quality parameters stabilized and were within acceptable ranges, samples were collected at the same low flow rate.

2.2.1 Approved Modifications to the Groundwater Monitoring Program

During the first year of RA(O), minor modifications were made to the groundwater monitoring program, in coordination with EPA and TCEQ.

- 67WW04: While 67WW04 was utilized historically to bound the plume to the south, new wells 67WW09A and 67WW10 now serve that purpose, providing better refinement of the plume boundary within the LUC boundary. 67WW04 will continue to be gauged for water level during each sampling event, but will no longer be sampled for volatile organic compounds (VOCs) or evaluated for field parameters.
- 67WW06: Based on changes in designation of groundwater bearing zones at LHAAP-67 described in the RACR (AECOM, 2015), co-located shallow zone monitoring wells 67WW06 and 67WW07 are now considered duplicative. Of the well pair, 67WW07 with a

shallower screened interval was retained for monitoring, while eliminating 67WW06 from further monitoring. Well 67WW06 will continue to be gauged for water level during each sampling event.

- Monitoring wells 67WW01 and 67WW08 were selected in the RAWP for collection of geochemical parameters. However, during the 1st year RA(O), 67WW01 was dry on two occasions and had insufficient water to collect MNA geochemical parameters on a third event. Therefore, MNA geochemical parameters were collected from 67WW11 in October 2013 instead. However, based on assessment of COC concentrations and location of monitoring wells with respect to the plume, it was determined in coordination with EPA and TCEQ that future sampling for MNA geochemical parameters will occur from monitoring well 67WW13 in addition to 67WW08. Because this decision to sample 67WW13 instead of 67WW11 was made in April 2015, well into the 2nd year RA(O) monitoring period, MNA samples were continued to be collected from 67WW11. During the 2nd year RA(O), MNA parameters were collected from 67WW11 during July and December 2014 and February 2015 sampling events and from 67WW13 in March and May 2015. 67WW01 was sampled for MNA parameters in May 2015 during the 2nd year RA(O). Therefore, MNA results became available for all four impacted wells 67WW01, 67WW08, 67WW11, and 67WW13.
- The previous top and bottom depths/elevations of the screened intervals for monitoring wells 67WW01, 67WW02, and 67WW03 were changed based on the results of a downhole camera survey performed in March 2015 to verify well construction. These screened intervals are presented in **Table 2-1** and are illustrated graphically in **Figure 2-11** (discussed later). The changes were minor and do not affect groundwater gauged elevation or gradient.

2.2.2 Groundwater Elevations and Flow Direction

During the July 2014 event, monitoring wells 67WW03 and 67WW04 were noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northwesterly (**Figure 2-2**).

The groundwater elevation data from 67WW01 and 67WW11 were not incorporated in the potentiometric contour map for July 2014, as it appears that their groundwater elevations do not correlate with the elevations of the surrounding wells. It is believed that the small amount of water measured in 67WW01 (0.8 to 1.4 feet) during these times may not be representative of the aquifer conditions. A review of the groundwater data for 67WW11 indicates that the well appears slow to respond to changing conditions that were observed during the sampling event (rain events).

During the December 2014 event, monitoring wells 67WW03 and 67WW04 were noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northerly (**Figure 2-3**). The groundwater elevation in 67WW02 in the central northern area of the site was high, disrupting the general pattern of groundwater flow to the north. During the February 2015 event, monitoring wells 67WW03 and 67WW04 were noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northwesterly (**Figure 2-4**).

The groundwater elevation data from 67WW01 and 67WW11 were not incorporated in the potentiometric contour map for February 2015, as it appears that their groundwater elevations do not correlate with the elevations of the surrounding wells for the same reasons presented for the July 2014 gauging event.

During the May 2015 event, monitoring well 67WW04 was noted to be dry. The presence of a dry well did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northwesterly (**Figure 2-5**).

Groundwater elevations generally decreased by up to one foot across the site between July 2014 and December 2014 and subsequently (between December 2014 and May 2015) rose by up to one foot across the site. However, some wells did not behave in the same general pattern. For example, groundwater elevations in 67WW01 and 67WW11 increased between July 2014 and December 2014 and decreased between December 2014 and February 2015. These are the two wells that had groundwater elevations that did not fit with the general groundwater potentiometrics in July 2014 and February 2015. Groundwater elevation in May 2015 increased with respect to February 2015 by up to 2 feet as a result of heavy rainfall that occurred in April and May 2015.

Monitoring well 67WW03, located north of the VOC plume area, was dry in the first three of the four quarterly monitoring events. This is likely because this well is relatively shallow compared to other wells with the bottom of the screen interval at 175.54 feet above mean sea level and the static water level is below the screen bottom. As such, limited data is available from this well for use in the MNA evaluation or analysis of plume extent and stability. In lieu of this well, monitoring well 67WW12 provide the needed information to evaluate plume extent and stability in this area of the site. Monitoring well 67WW04 remained dry throughout the sampling period. Groundwater was present in 67WW03 in May 2015 as a result of a general increase in groundwater level at the site.

Based on data collected during the second year of RA(O), groundwater flow direction is generally noted to be in the north/northwesterly direction. The interpretation of groundwater flow direction has altered slightly from what was presented in the 1st year RA(O) report which is most likely due to the variation in precipitation and groundwater elevation. In the first three events of the 1st year RA(O), the groundwater flow direction was interpreted to be predominantly to the north/northeast. The interpretation of groundwater flow direction changed in May 2014 to a north/northwesterly direction and coincided with an increase in groundwater elevation across the site. The groundwater elevation across the site during the 2nd year RA(O) remained similar to or higher than the May 2014 groundwater elevation and the interpretation of the predominant groundwater flow direction also remained in a north/northwesterly direction.

The interpreted groundwater flow direction observed during the 2nd year RA(O) differs from what was presented in the Remedial Design document (Shaw, 2011) (see **Figure 2-6**). This is likely due to the installation of additional monitoring wells which provide a better definition of the actual groundwater gradient, as well as the variable effects of the recent drought on individual wells.

2.2.3 Groundwater Analytical Results

Analytical results for the quarterly samples are presented on **Table 2-2**. **Figures 2-7 through 2-10** depict the VOC data in wells sampled in July 2014, December 2014, February 2015, and May 2015, respectively.

Over the course of the 2nd year of RA(O), wells 67WW01, 67WW08, 67WW09, 67WW11, and 67WW13, contained VOCs above the respective cleanup levels. The highest concentrations of VOCs were detected in wells 67WW01, 67WW08 and 67WW13. The trends of COC concentrations in monitoring wells with COC concentrations greater than the maximum contaminant level (MCL)/Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) (EPA, 2014) are depicted in graphs presented on **Figure 2-11**. The trend analysis is discussed in **Section 3.0**.

Historically, since December 1998 and prior to May 2013, concentrations of COCs in 67WW01 were greater than their MCLs as shown on **Table 2-3**. Other monitoring wells such as 67WW02 and 67WW03 had COCs greater than their MCLs (December 1998) but subsequent sampling events revealed COC concentrations below the laboratory detection limits until the May 2015 monitoring event which revealed concentrations of 1,1-DCE above the MCL for 67WW02.

An expanded discussion on the VOCs and their distribution including trends is included **Section 3.1**.

Groundwater monitoring well sampling forms were completed for each monitoring well sampled and are included in **Appendix C**. Laboratory analytical results are included in **Appendix D**.

2.3 Surface Water Sampling

As discussed in the LHAAP-67 site RACR, semi-annual sampling of surface water from one location in Central Creek was planned (AECOM, 2015). The Central Creek surface water sampling location was dry during the baseline groundwater monitoring event and no surface water sample was collected.

As reported in the 1st year RA(O), the addition of multiple new shallow zone monitoring wells, has resulted in more clearly defining the groundwater potentiometric surface for the site. Consequently, the shallow zone groundwater flow direction (identified as north/northeast from the 1st year RA(O) Report, and north/northwest from this RA(O) Report) indicates that Central Creek located south of the LHAAP-67 site is upgradient and, therefore, is not an appropriate surface water body to monitor for potential impacts from LHAAP-67. Further, the VOC plume is delineated within the LUC boundary and is not near any surface water body. Therefore, concurrence was obtained not to sample surface water from Central Creek.

As shown in **Figure 1-2**, Goose Prairie Creek is located downstream to the north but at a distance of more than 1,500 feet from the LHAAP-67 site. There is no other surface water body downgradient or in close proximity of the LHAAP-67 site to collect an appropriate surface water sample. Therefore, based on this information and concurrence from the TCEQ and EPA, no further surface water monitoring is conducted at the LHAAP-67 site.

Elevations are reported as feet above mean sea level (ft MSL)

[a] Screen information calculated from Data Gap Investigation Report (Shaw 2007).

[b] Screen information calculated from well construction detail forms

[c] Well screen top and bottom depths and elevations for monitoring wells 67WW01, 67WW02, and 67WW03 were revised/confirmed with a downhole camera survey performed in March 2015.

Dry=Insufficient or no water in well.

TOC=Top of Casing

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Location ID: / Sample Date:	Units	MCL/ PCL	67WW05-021015 2/10/2015	67WW05-051215 5/12/2015	67WW06-053113 5/31/2013	67WW06-053113-FD 5/31/2013	67WW06-092813 9/28/2013	67WW06-012414 1/24/2014	67WW07-053113 5/31/2013	67WW07-092713 9/27/2013	67WW07-012314 1/23/2014	67WW07-050614 5/6/2014	67WW07-072514 7/25/2014
Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	<0.04 U	NA	NA	<0.04 U	<0.04 U

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		<0.04 U	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	<0.04 U

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Ferrous Iron (SM3500FE)													
FERROUS IRON	mg/L		<0.04 U	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

3 NATURAL ATTENUTION EVALUTION

The following sections present the results of the natural attenuation evaluation in accordance with the three lines of evidence discussed in the Final Remedial Design (Shaw, 2011) for site COCs.

3.1 First Line of Evidence: Change in COC Concentrations over Time and with Distance

Natural attenuation is the combination of multiple mechanisms, including biodegradation, volatilization, dilution, advection, and absorption that reduce contaminant concentrations. The decrease of COC concentrations over time and distance is evidence of natural attenuation. The change in groundwater COC concentrations over time and with distance was evaluated at LHAAP-67. VOC concentrations for the 2014/15 period for the six wells with COC concentrations observed above the MCLs during the reporting period are identified on **Figure 2-11**.

Of all the wells included in the monitoring program, the wells that detected COCs above their respective cleanup levels are 67WW01, 67WW02, 67WW08, 67WW09, 67WW11, and 67WW13. The other wells in the monitoring program did not contain COCs above the cleanup levels in the four sampling events. Based on the general direction of groundwater flow, wells 67WW04, 67WW09A and 67WW10 can be considered background wells and monitoring wells 67WW12, 67WW02 and 67WW05 can be considered downgradient wells. In-plume wells include 67WW01, 67WW08, 67WW09, 67WW11, and 67WW13. Wells 67WW07 and 67WW14 are considered cross-gradient wells. The following discussion is focused on VOC trends noted in the six wells with COCs above the MCL: 67WW01, 67WW02, 67WW08, 67WW09, 67WW11, and 67WW13.

Well 67WW01

Data from this well is available beginning in 1998.

Groundwater data was collected during each of the four quarters of the 2014/15 sampling period. In the previous sampling period (2013/14) the well was dry in two of the four quarters of groundwater sampling. 67WW01 was included in the MNA well network. However, the well was not sampled for MNA when it was dry or when insufficient sample volume was available to collect MNA parameters from 67WW01. Under these circumstances, MNA parameters were collected from either 67WW11 or 67WW13. Discussion of MNA parameters and geochemical data is presented in **Section 3.2**.

Table 2-3 presents historical COC results for 67WW01. 1,1,1-TCA and 1,1,2-TCA were detected above the MCL in 1998 (**Table 2-3**); however, these constituents have remained below the MCL since that sampling event, presumably due to degradation to daughter products such as 1,1-DCE and 1,2-DCA. Since 1998 and throughout this sampling period, 1,1-DCE (degradation product of 1,1,1-TCA) and 1,2-DCA (degradation product of 1,1,2-TCA) were detected above the MCL. The concentrations of each of these COCs have increased over the 2014/15 sampling period. Vinyl chloride (VC) (a degradation product of TCE) has also been detected slightly above the MCL in December 2014 and February 2015 at 2.16 micrograms per liter (μg/L) and 2.38 μg/L, respectively but decreased to below the MCL in May 2015 to 1.86 μg/L J-flagged.

TCE levels in this well remained below the cleanup level during the 2-year RA(O) period, but were slightly above the MCL (concentrations ranged between 5.38 μg/L and 6.3 μg/L) between 1998 and 2006.

Mann-Kendall analysis for the data collected during the 2-year RA(O) period was completed for 1,1-DCE, 1,2-DCA, TCE, and VC. The results are presented in **Appendix E** in graphical format with statistical results presented on the right hand side. The U.S. EPA's ProUCL version 5.0 was used for this analysis. The dates are displayed in numerical format rather than in a date format as required by the program. The concentration of COCs are presented on the data points on the graph in μg/L. Half the detection limit was used for non-detects. The average concentration of the sample and its duplicate was used. The level of significance was 5%. A summary table of the Mann-Kendall results is presented below.

The trend analysis in 67WW01 during the past two years indicates a statistically significant increase in 1,1-DCE and 1,2-DCA concentrations over time and no identified significant trend for TCE and VC. The increase in 1,1-DCE and 1,2-DCA could be due to transport of high levels of these constituents from upgradient in the area of well 67WW08. However, it should be noted that only the last two sampling events (February 2015 and May 2015) have reported 1,1-DCE and 1,2-DCA at or above historical highs for 67WW01. VC could be a degradation component of 1,2-DCA.

Well 67WW02

Analytical data for 67WW02 was reported since 1998. 1,1,2-TCA was reported above the MCL at 6.4 μg/L and 5.9 μg/L in December 1998 but has not been reported above the MCL since that time. No other COC was reported above the MCL since 1998. However, an increase in 1,1-DCE was first observed above the reporting limit of 1 μg/L in February 2015 at 3.59 μg/L. 1,1-DCE concentration increased further in May 2015 to 13.1 μg/L above the MCL of 7 ug/L. 67WW02 is downgradient of the area represented by 67WW01 and 67WW08 and could be receiving 1,1-DCE from upgradient wells.

The trend analysis in 67WW02 during the past two years does not identify a significant change in concentration for any of the COCs even for 1,1-DCE. Because 67WW02 is a downgradient well, the concentration of 1,1-DCE in 67WW02 will be watched closely in future sampling events. Although 67WW02 is within the existing LUC boundary, should the concentration remain above the MCL, a new downgradient monitoring well outside the LUC boundary to provide a downgradient compliance well/sentry point may be required in the future.

Well 67WW03

A total of four historical data points between 1998 and 2006 are available for this well prior to the 2014-15 sampling period. No data were collected in 2013/2014 because the well was dry. In the December 1998 sample, 1,1,1-TCA, 1,1,2-TCA, and 1,1-DCE were reported at concentrations of 1,800 μg/L, 24 μg/L, and 36 μg/L, respectively. However, three subsequent samples collected between 2004 and 2006 did not have detectable concentrations of these compounds indicating that the initial detections in 1998 are suspect and/or not representative of shallow zone groundwater. During the first three-quarters of the 2014/15 sampling period the well was dry and not sampled. In May 2015, a water sample was obtained and analyzed, revealing non-detect levels for these COCs. Because this well has been chronically dry, it was

replaced by adjacent well 67WW12, which is screened over an interval that is approximately 10 feet deeper than well 67WW03. Concentrations of COCs in 67WW12 which was sampled in 2014/2015 and previously in 2013/214 RA(O) periods were non-detect, corroborating the May 2015 and 2004 to 2006 results from 67WW03.

Well 67WW08

This well was installed in 2013. TCE and VC have remained below the cleanup levels in this well and Mann-Kendall analysis indicates no significant change can be observed (**Appendix E**). Over the last two years, 1,1,2-TCA levels fluctuated close to its MCL of 5 µg/L and was at 4.5 µg/L J-flagged in May 2015. 1,1-DCE continued to increase from 1,890 ug/L in July 2014 to 2,320 µg/L in December 2014 before decreasing in concentration to 1,570 µg/L in May 2015. Mann-Kendall analysis for trend over eight (8) quarters of data for this well indicates a statistically significant increase. Since 1,1,1-TCA was not detected in this well (< 5 µg/L), the source of 1,1-DCE could be either degradation of sorbed 1,1,1-TCA or dissolution of sorbed 1,1-DCE. Upgradient wells 67WW10 and 67WW11 cannot provide an explanation for the increase in 1,1-DCE in 67WW08. 1,2-DCA levels reveal a trend similar to 1,1-DCE increasing from 98.9 ug/L in July 2014 to 106 µg/L in December 2014 before decreasing in concentration to 85.6 µg/L in May 2015, albeit those changes are much smaller than observed for 1,1-DCE. Mann-Kendall for 1,2-DCA indicates no significant trend for concentration changes. There are only two years of data for 67WW08, future sampling events will continue to evaluate trend analysis for COCs.

Well 67WW09

This well was installed in 2013. Only 1,1-DCE has been detected in this well above the MCL with the levels decreasing from 8.93 µg/L (July 2014) to 2.71 µg/L (May 2015). The highest concentration for 1,1-DCE was reported in January 2014 at 20.8 µg/L. A trend analysis for the concentrations of COCs in this well indicated a statistically significant evidence of a decreasing trend for 1,1-DCE. The decrease in 1,1-DCE concentration could be due to natural attenuation (e.g., dilution from clean upgradient groundwater observed in 67WW09A). 67WW09A was installed upgradient from 67WW09 to bound the plume in the south and upgradient direction. VOC data in well 67WW09A has remained below the cleanup levels. There are only two years of data for 67WW09, future sampling events will continue to evaluate trend analysis for COCs.

Well 67WW11

This well was installed in 2013. Similar to well 67WW09, only 1,1-DCE has been detected in this well above the MCL with the concentration levels increasing from 34.5 µg/L (July 2014) to 37.5 µg/L (December 2014) and then decreasing to 21.6 µg/L (May 2015). The highest concentration for 1,1-DCE was reported in June 2013 at 47.1 µg/L. The Mann-Kendall trend analysis indicated a statistically significant evidence of a decreasing trend for 1,1-DCE and no significant changes for other COCs (**Appendix E**). The decrease in 1,1-DCE concentration could be due to natural attenuation (e.g., dilution from clean upgradient groundwater observed in 67WW09A). Well 67WW09A was installed upgradient to bound the plume in the south direction and remains unimpacted. There are only two years of data for 67WW11, future sampling events will continue to evaluate trend analysis for COCs.

Well 67WW13

This well was installed in 2013. 1,1-DCE and 1,2-DCA have been detected above the MCLs in this well during the monitoring period. Both COCs slightly increased in concentrations during the 2014/2015 reporting period. 1,1-DCE levels increased from 362 µg/L (July 2014) to 522 µg/L (May 2015) and 1,2-DCA increased from 20.1 µg/L (July 2014) to 30.6 µg/L (May 2015). Only trace concentrations of VC were detected below the MCL during the monitoring period. During the two year RA(O) reporting periods, 1,1-DCE, 1,2-DCA, and TCE concentrations decreased between May 2013 reaching a low in May 2014, increasing thereafter to reach a new high in May 2015. This trend was also observed for VC between May 2013 and December 2014 but the trend was reversed during February and May 2015 sampling events. This could be related to degradation of VC under oxidative conditions in this well (discussed in **Section 3.2**). Mann-Kendall for the four parameters in this well over the two year RA(O) period indicated insufficient statistical evidence of a significant trend in concentrations. There are only two years of data for 67WW13, future sampling events will continue to evaluate trend analysis for COCs.

Mann-Kendall Trend Summary

Monitoring Well	1,1-DCE	1,2-DCE	TCE	VC
67WW01	**Significant Increase**	**Significant Increase**	No significant trend	No significant trend
67WW02	No significant trend	No significant trend	No significant trend	No significant trend
67WW08	**Significant Increase**	No significant trend	No significant trend	No significant trend
67WW09	**Significant Decrease**	No significant trend	No significant trend	No significant trend
67WW11	**Significant Decrease**	No significant trend	No significant trend	No significant trend
67WW13	No significant trend	No significant trend	No significant trend	No significant trend

3.1.1 Plume Stability

COC plume maps completed for each sampling event are presented in **Figures 2-7** through **2-10**. The COC data over the monitoring period indicate no plume migration except for the May 2015 data which indicates a potential shift in the plume to the north, compared to previous periods. This shift is in line with the groundwater flow direction to the north/northwest. Based on the general direction of groundwater flow (towards the north/northwest), the following wells can be considered to be along the groundwater flow path: 67WW10, 67WW11, 67WW08, 67WW01, 67WW13, and 67WW05. 67WW02 can be considered a downgradient well from the area to the east of 67WW08/67WW01 depending on groundwater flow pattern.

The COCs in upgradient well 67WW10 which was installed in 2013 have remained below the cleanup levels throughout the reporting period. The in-plume well 67WW11 which is the most upgradient well exhibited a significant decreasing trend of 1,1-DCE, which could be due to natural attenuation associated with dilution effect of clean groundwater from upgradient areas. The in-plume well 67WW08 exhibits the highest levels of COCs and has exhibited a statistically significant increase in 1,1-DCE concentration during the eight (8) RA(O) periods. Depending on groundwater flow direction, monitoring well 67WW01 could be considered a downgradient well

for 67WW08, which exhibits lower concentrations of 1,1,2-TCA, 1,1-DCE, and 1,2-DCA than in 67WW08, which is a typical decreasing concentration of COCs with distance from the source. Concentrations of 1,1-DCE and 1,2-DCA exhibited a statistically significant increase over the 8 quarter RA(O) period, which could be related to transport of COCs from upgradient area in the vicinity of 67WW08. Monitoring well 67WW13 located downgradient from 67WW01 exhibited decreases then increases in COC concentrations over 8 quarters with no observed significant trend. An attempt to correlate changes in concentration to groundwater elevation did not provide any relationship with a slightly positive correlation observed for 1,2-DCA (21%) and a negative correlation for 1,1-DCE (-34%). It appears that the plume is stable in this area of the site. 1,1-DCE concentration in the other downgradient well 67WW02 appears to be increasing slightly from below the MCL of 7 μg/L to above the MCL at 13.1 μg/L. 67WW02 is downgradient of the area represented by 67WW01 and 67WW08 and could be receiving 1,1-DCE from upgradient wells. Because 67WW02 is a downgradient well, the concentration of 1,1-DCE in 67WW02 will be watched closely in future sampling events. The most downgradient well at the site 67WW05 has not exhibited detections of any COC since well installation in 2000.

Monitoring wells 67WW03 and 67WW12 are considered downgradient from the area of wells 67WW06 and 67WW07. The downgradient well 67WW03 (located in close proximity to 67WW12) was dry in first three of the four sampling events during the 2nd year RA(O) period. In the fourth event (May 2015), this well had no detections of COCs. Prior to May 2015, the well also had no detections of COCs in 2004 and 2006. The high concentrations of 1,1,1-TCA, 1,1,2-TCA, and 1,1-DCE reported in this well in December 1998 appeared to have attenuated before September 2004 and remain below detection. Similarly, 67WW12 installed to replace then dry well 67WW03 did not have any detections of the COCs for the past 8 quarters.

Concentrations of COCs in perimeter wells (boundary area wells 67WW02, 67WW12, 67WW07, 67WW10, 67WW09A, 67WW14, and 67WW05) surrounding the most impacted wells 67WW01 and 67WW08 in all directions have identified no increase or new detections of COCs with the exception of 67WW02. Boundary well 67WW02, was located on a potentiometric surface high during the 1st half of the monitoring period and had no detections of COCs. During the 2nd half of the monitoring period 67WW02 became a downgradient well, and coincided with an increase in 1,1-DCE to above the detection level for the first time since it was detected in December 1998. 1,1-DCE was detected below the MCL in February 2015, and then above the MCL in May 2015 for 67WW02. Therefore, 1,1-DCE appears to be migrating northward, however this is based on data from one sampling event (May 2015) and future sampling events will continue to evaluate plume migration. Boundary well 67WW07, generally classified as a cross-gradient to upgradient well, had low and stable detections of 1,2-DCA consistently below the MCL. Boundary well 67WW09A, an upgradient well which was installed in 2013, had no detections of any COCs during the 8 quarter RA(O) period. Boundary well 67WW14, a cross gradient to an upgradient well installed in 2013, had low and stable detections of 1,1-DCE and 1,2-DCA consistently below the MCLs. Boundary well 67WW05, generally considered a down-gradient well, had no detections of any COCs since it was first sampled in 2000. **Table 2-3** presents the analytical results in these wells.

Although only a few data points exist, the relationship between groundwater level elevations and COC concentrations were graphed in individual wells over the course of the monitoring period, as depicted in Figure 2-11. A review of the data does not indicate any definite correlation

between groundwater elevations and COC concentrations. For example, 1,1,2-TCA in 67WW08 had a 2% correlation coefficient with groundwater elevation, 1,1-DCE in 67WW08 had a 47% correlation coefficient with groundwater elevation, and 1,2-DCA in 67WW08 had a 37% correlation coefficient with groundwater elevation. These disparate correlation coefficients between COCs and groundwater elevation change in the same well indicate the weak seasonal effects on well COC concentrations (the effect of degradation of 1,1,1-TCA to 1,1-DCE does not change this conclusion considering that the concentration of 1,1,1-TCA did not change much with a range of 4.25 μg/L and 7.74 μg/L during the 8 quarter RA(O) period and the concentration of 1,1-DCE in this well is approximately 2.5 orders of magnitude greater than 1,1,1-TCA). Another example for change in 1,1-DCE concentration versus groundwater elevation change across several wells reveal the following results: 47% correlation coefficient in 67WW08, -94% correlation coefficient in 67WW09, -84% correlation coefficient in 67WW11, -32% correlation coefficient in 67WW13, and 71% in 67WW01. These widely dispersed correlation coefficients for the same COC across several monitoring wells indicate the lack of a defined correlation between COC concentration and groundwater levels or lack of seasonality effects. The supporting data for the correlation coefficients are provided in Appendix F.

3.2 Second Line of Evidence: Geochemical Indicators

Table 2-2 presents geochemical indicators that are useful MNA evaluation parameters. Some geochemical indicators are collected in the field, and are recorded for all sampling events for all wells. The field parameters for LHAAP-67 wells include: dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, conductivity, turbidity, ferrous iron, and temperature. DO measurements collected from bailed wells were considered inadequate and are not included in **Table 2-2**.

DO is the most thermodynamically favored electron acceptor used by microbes for biodegradation of organic carbon, whether natural or anthropogenic (USEPA, 1998). Anaerobic bacteria generally cannot function at DO concentrations greater than about 0.5 milligrams per liter (mg/L) and hence, reductive dechlorination will not occur. Wells 67WW01, 67WW02, 67WW03, 67WW05, and 67WW07 were sampled by bailing and the DO concentrations in these wells are not included in **Table 2-2** in accordance with the revised IWWP (AECOM, July 2014). In the two most contaminated wells, 67WW08 and 67WW13, the DO concentrations have ranged from 0 mg/L to 1.75 mg/L. The low DO level in 67WW08 with a maximum reported concentration of 0.66 mg/L in May, 2015 bodes well for reductive dechlorination. DO concentration in 67WW11 was also low with a maximum reported concentration of 1.07 mg/L.

The ORP levels indicate how oxidative or reductive the groundwater is in the aquifer matrix and provide real-time data if conditions are conducive for anaerobic biodegradation. ORP values less than 50 milli-volts (mV) are indicative that the aquifer is reaching anaerobic conditions and are favorable for the biological reductive dechlorination of chlorinated ethenes and ethanes. The ORP measurements at LHAAP-67 during the monitoring period have generally been negative in the highest contaminated well (67WW08) ranging between -16 mV (May 2015) to 45 mV (February 2015). In other wells within the plume (67WW09, 67WW11, and 67WW13), the ORP ranged between 164 and 310 mV in 67WW09, between 165 and 246 mV in 67WW11, and between 145 and 219 mV in 67WW13. These levels indicate a higher level of oxidative conditions, not supporting reductive dechlorination. The oxidative conditions in 67WW13 may be contributing to oxidation of formed VC, resulting in decrease in its concentration in this well

over time. Although, the decrease was not found to be statistically significant, the VC concentration had decreased from above the MCL during the first three sampling quarters to below the MCL thereafter. In 67WW01 the ORP ranged between -101 and 107 mV indicating oxidative to reducing conditions, noting that the ORP data from this well were collected from bailed samples. Given the presence of biodegradation products (1,2-DCA) in well 67WW08, the aquifer conditions (low DO and negative ORP) appear to be conducive for reductive dechlorination in the vicinity of 67WW08. However, over the entire extent of the plume, the conditions are generally aerobic and do not support reductive dechlorination.

After DO has been depleted in the microbiological treatment zone, nitrate may be used as an electron acceptor for anaerobic biodegradation of organic carbon via denitrification. In order for reductive dechlorination to occur, nitrate concentrations in the contaminated portion of the aquifer must be less than 1.0 mg/L (USEPA, 1998). **Table 2-2** indicates that nitrate concentrations were generally below the laboratory reporting limits at LHAAP-67 groundwater with one reported concentration of 2 mg/L J-flagged in 67WW08 in December 2014. This concentration is believed to be inconsequential to biodegradation and aquifer conditions. Nitrite was reported above detection in 67WW08 (2.04 mg/L J-flagged in December 2014 and 3.95 mg/L J-flagged in May 2015), 67WW11 (1.97 mg/L J-flagged in December 2014), and 67WW13 (3.4 mg/L J-flagged in May 2015). These reported nitrite concentrations are estimated and do not appear to be consequential to degradation of COCs at the site. Therefore, nitrate reduction is not likely a mode of microbial respiration at the site, and the lack of nitrate is favorable for achieving the highly reducing conditions ideal for anaerobic reductive dechlorination.

In some cases, iron (III) (ferric iron) is used as an electron acceptor during anaerobic biodegradation of organic carbon. During this process, iron (III) is reduced to iron (II) (ferrous iron), which may be soluble in water. Ferrous iron concentrations can thus be used as an indicator of anaerobic degradation of fuel compounds, and VC. Ferrous iron concentrations were measured in wells 67WW01 and 67WW08 and ranged from 0.0907 mg/L to 0.944 mg/L in 67WW08 and was reported at 0.0539 mg/L (a single measurement conducted in May 2015) in 67WW01. No ferrous iron was reported in 67WW11 and 67WW13 (< 0.04 mg/L). Ferrous iron concentrations reflect limited reductive dechlorination is occurring.

After DO and nitrate have been depleted in the microbiological treatment zone, sulfate may be used as an electron acceptor for anaerobic biodegradation. This process is termed “sulfate reduction” and results in the production of sulfide. Concentrations of sulfate greater than 20 mg/L may cause competitive exclusion of dechlorination. However, in many plumes with high concentrations of sulfate, reductive dechlorination still occurs (USEPA, 1998).

Table 2-2 indicates that the sulfate concentrations ranged from 143 mg/L in 67WW01 to 524 mg/L in 67WW08 during the May 2015 sampling event. Relatively high concentrations of sulfate and corresponding sulfide concentrations below laboratory reporting limit of 1 mg/L indicate that the conditions in the aquifer are not conducive for sulfate reduction.

Methanogenesis occurs in highly reducing conditions and generally occurs after oxygen, nitrate, and sulfate have been depleted. Methane levels above 500 µg/L is considered to indicate methanogenic conditions (USEPA, 1998). Methane was measured in wells 67WW01, 67WW08, 67WW11, and 67WW13 and was found to be lower than 20 µg/L.

Regardless of the electron acceptor being used, organic carbon is a required source of reduced carbon and energy to sustain microbial activity. Total organic carbon (TOC) is utilized as a carbon and energy source to support the reductive dechlorination of the chlorinated COCs. TOC concentrations greater than 20 mg/L are considered adequate to support microbial activity (USEPA, 1998). TOC concentration was measured in wells 67WW01 and 67WW08 and was found to generally be below 20 mg/L, with the exception of the February 2015 sample from 67WW08 which had a TOC concentration of 22.4 mg/L and in 67WW13 with a concentration of 62.4 mg/L in May 2015. Therefore, TOC does not seem to play a significant role in assisting reductive dechlorination.

The pH of ground water has an effect on the presence and activity of microbial populations in ground water. This is especially true for bacteria responsible for reductive dechlorination. Microbes capable of degrading chlorinated aliphatic hydrocarbons and petroleum hydrocarbon compounds generally prefer pH values varying from 6 to 8 standard units (USEPA, 1998). The shallow zone groundwater pH within the plume ranged between 5.32 and 7.25 standard units with pH geomean values of 6.5 standard units in wells 67WW01 and averaging 6.6 standard units in 67WW08. The conditions in these wells should be supportive for dechlorinating bacteria but do not provide an optimal environment.

Ethane and ethene, the two end products of the reductive dechlorination pathways for chlorinated ethanes and ethenes, were also below the laboratory reporting limits during the monitoring period in 67WW01, 67WW08, 67WW11, and 67WW13 indicating that complete dechlorination is not taking place.

The qualitative assessment of geochemical indicators in the shallow groundwater zone at LHAAP-67 indicates current geochemical conditions are not optimal for MNA. Nonetheless, certain parameters observed in a few locations may indicate that conditions could favor natural attenuation, such as the low DO and slightly negative ORP observed in 67WW08. The presence of methane and dissolved iron also provides evidence that reducing anaerobic conditions are present. Although, degradation products (1,2-DCA, 1,1-DCE, and VC) have been detected in the plume monitoring wells, adequate conditions within the impacted area currently do not exist to sustain complete reductive dechlorination.

3.3 Third Line of Evidence: Predictive Modeling and Microbial Analysis

If the first two lines of evidence for MNA are deemed inadequate or inconclusive, and/or if the need for a contingency remedy is evaluated, data from field or microcosm studies will be necessary to establish the third line of evidence for MNA.

Dechlorinating bacteria, dehalococcoides ethenogenes and associated functional genes were analyzed in wells 67WW01, 67WW08, 67WW11, and 67WW13 located within the VOC plume. Generally, the microbial population count and the functional gene counts were very low (less than 100 CEQ/mL) and in most cases below the laboratory reporting limits, indicating limited population count of the bacteria and absence of gene expression necessary for anaerobic biological degradation of the COCs.

Of the analyzed parameters and wells using Mann-Kendall, only two data sets showed a significant decrease in concentration over time (1,1-DCE in 67WW09 and 67WW11). Of those 1,1-DCE in 67WW09 decreased to below the MCL. For 1,1-DCE in 67WW11, the first order

rate constant was estimated at 0.033 yr^{-1} and the time to achieve the MCL of 7 μg/L is estimated at 35 years. Degradation of COCs in other wells is not occurring to allow a determination of time to achieve the MCL (i.e., predictive modeling by assuming some degree of degradation and degradation half-lives is not meaningful for this plume).

4 SUMMARY AND CONCLUSIONS

VOC data and geochemical indicators were collected over the course of the monitoring period at LHAAP-67 to evaluate effectiveness of MNA as a site remedy. A tiered approach assessing the first two of three lines of evidence was used to evaluate the occurrence of natural attenuation in site groundwater. The first line of evidence evaluated reductions in COC concentrations over time and with distance, the second line of evidence evaluated geochemical indicators, while the third line of evidence evaluated microbial conditions in the aquifer and assessed the time to achieve the MCL for wells that showed significant decrease in concentration using the Mann-Kendall test for trends. The results of the tiered evaluation and the conclusions are summarized below.

An assessment of the first line of evidence indicated that the plume appears to be migrating to the north in the predominant direction of groundwater flow gradient. This is evidenced by decreasing 1,1-DCE concentration in 67WW09 and increasing 1,1-DCE concentration in 67WW02. However this observation is based on data from one sampling event (May 2015) for 67WW02 and future sampling events will continue to evaluate plume migration. The in-plume well (67WW08) exhibits the highest levels of COCs which have generally remained stable, with 1,1,-DCE, exhibiting a statistically significant increasing trend during the 8 quarter RA(O) reporting period. Monitoring well 67WW01 which depending on groundwater flow direction could be considered a downgradient well for 67WW08 exhibits lower concentrations of 1,1,2-TCA, 1,1-DCE, and 1,2-DCA than in 67WW08, which is a typical decreasing concentration of COCs with distance from the source. 1,1-DCE concentration in 67WW01 also exhibited a statistically significant increase over the 8 quarter reporting period, which could be associated with migration of 1,1-DCE from 67WW08 towards 67WW01. However, only the last two sampling events (February and May 2015) for 67WW01 had 1,1-DCE above historical highs. A similar decreasing COC concentration trend is made between 67WW01 and downgradient well 67WW02. The downgradient well 67WW03 (located in close proximity to 67WW12) has been dry in three of the four events. In the fourth event (May 2015) this well had no detections of COCs. This corroborates the data obtained in 2004 and 2006. 1,1-DCE in downgradient well 67WW02 increased to above its MCL in one sampling event (May 2015). Therefore, based on the inferred flow path (using the groundwater flow direction), COC levels appear to be slightly increasing with distance from the source area to the north. There are only two years of data for four of the wells inside the plume (67WW08, 67WW09, 67WW11 and 67WW13), future sampling events will continue to evaluate trend analysis for COCs.

1,1-DCE in 67WW09 and 67WW11 has significantly decreased over time. This is likely due to dilution from clean upgradient groundwater. Otherwise, Mann-Kendall did not identify statistically significant changes in COC concentrations, although changes in concentrations can be observed in general.

Concentrations of COCs in boundary wells 67WW12, 67WW10, 67WW09A, 67WW14, and 67WW05 surrounding the most impacted wells 67WW01, 67WW08, and 67WW13 have remained non-detect or below the MCL, indicating no plume migration in those areas, with the exception of 67WW02 as discussed above.

The qualitative assessment of geochemical indicators and the absence of dechlorinating bacteria in the shallow groundwater zone at LHAAP-67 indicate current geochemical conditions are not

optimal for MNA. Although, degradation products (1,2-DCA, 1,1-DCE, and VC) have been detected in the plume monitoring wells, adequate conditions within the impacted area currently do not exist to sustain complete reductive dechlorination.

Statistical significant decrease of COCs that are above the MCL was observed only in well 67WW11 for 1,1-DCE and a first order rate constant was estimated at 0.33 yr^{-1}. From this information the time to achieve the MCL in this well was estimated at 35 years. The primary mechanism for the decrease in concentration in 67WW11 is determined to be dilution.

Based on the collected data thus far, MNA associated with biodegradation appears not to be occurring in the shallow groundwater at LHAAP-67. The concentration decrease observed in some COCs in some wells are likely associated with other MNA occurrences such as dilution and volatilization. The VOC plume has appeared stable with no observed migration, with the exception of the recent February and May 2015 data for 67WW01 indicating an increase above historical results and the May 2015 data for 67WW02 indicating a potential northern expansion. Future sampling events will continue to evaluate plume stability and migration.

After completion of the first 2-year RA(O) period, groundwater monitoring on a semi-annual basis will continue to be performed at LHAAP-67 in compliance with the Remedial Action Work Plan (AECOM, 2013). However, collection of additional MNA parameter data from the site will not be conducted in the future. No change in land or groundwater use has occurred at the site, and the use of the site is still consistent with that mandated by the ROD.

Inspection of monitoring wells 67WW01, 67WW02, and 67WW03 with a downhole camera was conducted in March 2015 to confirm the discrepancies identified between the well logs and the total depth measured in the field. The information indicated the presence of slight discrepancies but did not affect groundwater gauged elevation or gradient.

APPENDIX A: ANNUAL LUC COMPLIANCE CERTIFICATION DOCUMENTATION

Annual Land Use Control Compliance Certification Documentation

In accordance with the Remedial Design dated August 2011, for LHAAP-67 a certification of site was conducted by AECOM Technical Services, Inc. on July 14, 2015.

A summary of land use control mechanism is as follows:

- Groundwater restriction – restriction of the use of groundwater to environmental monitoring and testing until cleanup levels are met.

A summary of compliance with land use and restriction covenants is as follows:

- No use of groundwater, installation of new groundwater wells, or tampering with existing wells at LHAAp-67.

I, the undersigned, do document that the certification was performed as indicated above, and that the above information is true and correct to the best of my knowledge, information, and belief

Date: July 14, 2015

Kayla Teague
AECOM Technical Services, Inc.
16000 Dallas Parkway
Dallas, TX 75248

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Kathy Albertson – Team Chemist/Data Specialist
(740) 373-4071
Kathy.Albertson@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on August 04 2014

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
0019498	I	1.399999976158142		J2317156199	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	Yes
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Microbac Laboratories
Case Narrative

Login Number: L14071430
Department: Volatiles - GC
Analyst: Jared Smith

Analysis RSK-175

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes/Sample Duplicates: The MS/MSD results were not associated with this sample delivery group (SDG), due to insufficient volume of sample. Microbac Laboratories recommends site specific MS/MSD samples to avoid possible data qualifications.

SAMPLES

Samples: All acceptance criteria were met.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071430
Project Name:		**Method:**	8260
Prep Batch Number(s):	485785	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-07-29 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?		X			1
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071430

LRC Date:	2014-07-29 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?		X			3
Was the ICAL curve verified for each analyte?		X			2
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):	X				
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071430
Project Name:		**Method:**	FERROUS
Prep Batch Number(s):	WG486133	**Reviewer Name:**	Deanna Hesson
LRC Date:	2014-07-31 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?	X				
Were analytical duplicates analyzed at the appropriate frequency?	X				
Were RPDs or relative standard deviations within the laboratory QC limits?	X				
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?			X		
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071430

Prep Batch Number(s):	WG486133	**Reviewer Name:**	Deanna Hesson
LRC Date:	2014-07-31 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?			X		
Were ion abundance data within the method-required QC limits?			X		
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?			X		
Raw data (NELAC Section 5.5.10)			X		
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?			X		
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)			X		
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions			X		
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

The data have been reviewed and are technically compliant with

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071430
Project Name:		**Method:**	TOC
Prep Batch Number(s):	WG485904	**Reviewer Name:**	Deanna Hesson
LRC Date:	2014-07-31 00:00:00		

the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

2.1.2 RSK 175

2.1.2.1 Summary Data

Microbac Laboratories
Case Narrative

Login Number: L14071430
Department: Volatiles - GC
Analyst: Jared Smith

Analysis RSK-175

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes/Sample Duplicates: The MS/MSD results were not associated with this sample delivery group (SDG), due to insufficient volume of sample. Microbac Laboratories recommends site specific MS/MSD samples to avoid possible data qualifications.

SAMPLES

Samples: All acceptance criteria were met.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

2.1.2.2 QC Summary Data

RSK-175 - Example Calculation for Methane

1.0 Linear Calibration Models

Option A - Average RF Method

ICAL_x	ICAL_r		RF
1.67	19901		11917
6.67	69174		10371
16.7	176923		10594
66.7	685135		10272
133	1324853		9961
300	2845104		9484
		Average RF:	**10433**

Where:
ICAL_x = the ICAL concentration
ICAL_r = the ICAL response (area)
RF = calibration factor = ICAL_r / ICAL_x

Option B - Agilent Linear Regression Constant

ICAL_x	ICAL_r	[ICAL_r}^2	[ICAL-x][ICAL-r]
1.67	19901	396049801	33235
6.67	69174	4785042276	461391
16.7	176923	31301747929	2954614
66.7	685135	4.6941E+11	45698505
133	1324853	1.75524E+12	176205449
300	2845104	8.09462E+12	853531200
Summation:		**1.03557E+13**	**1078884393**

Agilent Linear Regression Constant : **9598.567853**
(1.03557E+13)/1078884393)

2.0 Calculate the concentration in extract, Cx

Where:

y = area response of methane from quant report	**1157414**
a = average RF (or Agilent regression constant)	**10433.00**
Cx = y/a	**110.9377935**

3.0 Calculate the concentration in sample

Cs = Cx (MW/Tf) (HS/S) (DF)

Where:

Cx = Concentration in extract	**110.9377935**	umol/mol
MW = molecular weight of analyte	**16.04**	ug/umol
TF = temperature factor = (22.4)(313/273)	**25.68**	L/mol
HS = headspace volume	**0.015**	L
S = sample volume remaining after headspace removal	**0.00547**	L
DF = dilution factor	**2**	
Cs = calculated sample concentration	**380.034301**	ug/L

RSK-175 - Example Calculation for Carbon Dioxide

ICAL Plot - Quadratic Regression (y = Ax^2 + Bx +C)

Ax^2 + Bx + (C - y) = 0

Step 1 - Calculate the concentration in extract, Cx

Data from quadratic regression plot:		
Value of A from plot:	**0.916**	
Value of B from plot:	**1540**	
Value of C from plot:	**0**	
Response for methane from quantitation report (y):	**8763828**	
Value of C - y	**-8763828**	
Solving for Cx using the quadratic formula:		
Root 1 - Computed Cx1:	**2364.716284**	umol/mol
Root 2 - Computed Cx2:	**-4045.938991**	

Step 2 - Calculate the concentration in sample

Cs = Cx (MW/Tf) (HS/S) (DF)

Where:

Cx = Concentration in extract :	**2364.716284**	umol/mol
MW = molecular weight of analyte:	**44.0**	ug/umol
TF = temperature factor = (22.4)(313/273):	**25.68**	L/mol
HS = initial headspace volume (extraction log):	**0.015**	L
S = final volume (extraction log):	**0.00547**	L
DF = dilution factor:	**10**	
Cs = calculated sample concentration:	**111106.798**	ug/L

Other Notes:

Temperature of headspace = 40 C = 313 K

Analyte	**MW (g/mol)**
Methane	16.04
Ethane	30.07
Ethene	28.05
Propane	44.1
Carbon Dioxide	44.0

2.2.1.2 QC Summary Data

Example Calculations - Ion Chromatography

A. Methods 9056/300.0 (Quadratic with Offset)

1. Retrieve Curve Data from the ICAL Curve

c2 = the value of curve constant
c1= the curve slope
c0 = the curve offset

2. Obtain the area, y , from the instrument raw data

3. Calculate the concentration of the analyte, f(y), where:

$$f(y) = \frac{1}{2 * c_2} * \left(-c_1 \pm \sqrt{c_1^2 - 4 * c_2 * (c_0 - y)}\right)$$

Example Calculation:

Value of constant, c2, (curve):	0.0003
Value of curve constant, c1, (slope):	0.0869
Value of curve constant, c0, (offset):	-0.0103
Area of target analyte, y, (uS*min):	2.993
Calculated concentration, f(y), (mg/L):	31.1998864
or:	-40.1161215 *
Dilution factor (D):	1.00
Concentration of analyte in sample (mg/L):	31.200

* There are two possible solutions, but only one is valid.

B. Method 314.0 - Perchlorate (Linear)

Retrieve Curve Data from Linear Plot

c1 = the curve slope

Obtain the area, y , from the quantitation report

Calculate the concentration of the analyte, f(y), where:

f (y) = y / c1

Example Calculation:

Value of c1, slope:	0.0034
Area of target analyte, y:	0.083
Calculated concentration:	24.4117647
Dilution Factor:	1
Concentration in sample:	24.4117647

CONTINUING CALIBRATION BLANK (CCB)

Login Number: L14071430
Run Date: 07/25/2014
Sample ID: WG485779-06
Instrument ID: IC1
Run Time: 21:52
Method: 9056
File ID: I1 072514-28
Analyst: ALS
Units: mg/L
Workgroup (AAB#): WG485778
Cal ID: IC1 - 11-JUN-14
Matrix: WATER
QAPP: DOD4

Analytes	MDL	RDL	Concentration	Qualifier
Chloride	0.100	0.400	0.100	U
Sulfate	0.500	2.00	0.500	U
Nitrate	0.100	0.400	0.100	U
Nitrite	0.100	0.400	0.100	U

U = Result is less than MDL.
F = Result is between MDL and RL.
* = Result is above RL.

2.2.2.2 QC Summary Data

Example Calculations for Visible Spectrophotometric Methods

Linear Calibration Model

Step 1 - Retrieve Curve Data from ICAL

m = slope of the linear equation
b = intercept from the linear equation
y = instrument response as absorbance or OD
x = concentration of analyte (mg/L)
y = mx + b

Step 2: Calculate the instrument concentration, x

Where:

x = (y - b)/m

Step 3: Solve for analyte concentration in sample, Cx

Cx = (x) (D)

Example Calculation (LCS):

Value of m from plot:	7.809
Value of b from plot:	0.0004135
Absorbance of unknown from quantitation report (y):	0.31
Calculated concentration (x):	0.03964483
Dilution factor (D):	1.00
Concentration of analyte in sample, Cy:	0.0396 mg/L

SmartChem Autoanalyzer - Quadratic Calibration for Chloride and Sulfate

Step 1 - Retrieve Curve Data from Smartchem ICAL

A, B, C = constants from the ICAL quadratic regression

x = instrument response as absorbance or OD

y = concentration of analyte (mg/L)

Step 2: Calculate the instrument concentration, y

Where:

y = Ax^2 + Bx + C

Step 3: Solve for analyte concentration in sample, Cy

Cy = (y) (D)

Example Calculation (LCS):

Value of A from plot:	101.2796
Value of B from plot:	318.9056
Value of C from plot:	-2.2712
Absorbance of unknown from quantitation report (x):	0.1583
Calculated concentration (y):	50.7495108
Dilution factor (D):	1.00
Concentration of analyte in sample, Cy:	50.75 mg/L

2.2.3.2 QC Summary Data

Example Total Sulfide(Liquid) Calculations

[mL Iodine * N Iodide) - (mL titrant * N titrant)] * 16000/(volume * dilution) = mg/L Sulfide

where:

mL Iodine = mL of Iodine used
N Iodine = normality of Iodine
mL titrant = mL of titrant used
N titrant = normality of titrant
16000 = factor: 1mL of 0.025 N iodine reacts with 0.4mg sulfide
volume = mL filtered of mL titrated(if not filtered)
dilution = dilution in decimal form (1/5 = 0.2)

Example Total Sulfide(Soil) Calculations

[(mL Iodine * N Iodine) - (mL titrant * N titrant)] * 16.03/weight = mg/kg sulfide

where:

mL Iodine = mL of Iodine used
N Iodine = normality of Iodine
mL titrant = normality of titrant
16.03 = 32.06 grams per 2 equivalents
weight = kg of sample used

2.2.4.2 QC Summary Data

Total Organic Carbon Example Calculations
(Direct Readout Parameter)

(Readout)/(dilution) = mg/L

where:

Readout = direct readout from the instrument
dilution = dilution in decimal form (ex. 1/5 dilution = 0.2)

List of Valid Qualifiers
August 04, 2014

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
CT1	The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
J,H1	Estimated value ; the analyte concentration was less than the LOQ. Sample analysis performed past holding time.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, H1	Not detected; Sample analysis performed past holding time.
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
TNTC, B	Too numerous to count. Analyte present in method blank.
U	Analyte was not detected. The concentration is below the reported LOD.
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit

Microbac Laboratories Inc.
List of Valid Qualifiers
August 04, 2014

Qualkey: DOD

X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - May 22, 2014

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVL NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Thiodiglycol (TDG-LCMS)
Acetate (HPLC-UV)
Formate (HPLC-UV)
Acetaldehyde (HPLC-UV)
Propionaldehyde (HPLC-UV)
Fluoroborate (ISE)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVL MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam

Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL MSV0I/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVL RSKOI/GC-FID

Isobutane
n-Butane
Propane
Propylene
Propyne

OVL HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

SOLID AND HAZARDOUS CHEMICALS

OVL MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVL MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

Microbac

Laboratory Report Number: L14071626

Kayla Teague
AECOM Technical Services, Inc.
16000 Dallas Parkway
Dallas, TX 75248

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Kathy Albertson – Team Chemist/Data Specialist
(740) 373-4071
Kathy.Albertson@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on August 05 2014

David Vandenberg – Managing Director

State of Origin: TX
Accrediting Authority: Texas Commission on Environmental Quality ID:T104704252-07-TX
QAPP: DOD Ver 4.1

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
0019643	I	2.0		J2317156215	X
0019426	I	3.0		J2317156224	X
0015779	I	4.0		J2317156206	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071626
Project Name:		**Method:**	8260
Prep Batch Number(s):	486191, 486305, 486696	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-08-05 00:00:00		

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071626
Project Name:		**Method:**	8260
Prep Batch Number(s):	486191, 486305, 486696	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-08-05 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?		X			2
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?		X			1
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X			5
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071626
Project Name:		**Method:**	8260
Prep Batch Number(s):	486191, 486305, 486696	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-08-05 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?		X			4
Was the ICAL curve verified for each analyte?		X			3
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071626
Project Name:		**Method:**	8260
Prep Batch Number(s):	486191, 486305, 486696	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-08-05 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L14071626
Project Name:		**Method:**	8260
Prep Batch Number(s):	486191, 486305, 486696	**Reviewer Name:**	Michael Albertson
LRC Date:	2014-08-05 00:00:00		

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1) The RPD for dichlorodifluoromethane, vinyl chloride, and chloromethane exceeded the UCL in the LCS/LCSD analyzed 08/01/14 on HPMS9.
2) Dichlorodifluoromethane and 2-hexanone exceeded the UCL in the LCS analyzed 07/29/14 on HPMS11. Chloromethane and dichlorodifluoromethane exceeded the UCL in the LCS analyzed 07/30/14 on HPMS9.
3) n-Butylbenzene and dichlorodifluoromethane exceeded the UCL in the ICV analyzed 06/27/14 on HPMS11. Dichlorodifluoromethane exceeded the UCL in the ICV analyzed 07/26/14 on HPMS9.
4) 2-Hexanone exceeded the UCL in the CCV analyzed 07/29/14 on HPMS11. Chloromethane was below the LCL in the CCV analyzed 07/30/14 on HPMS9.
5) 1,2-Dibromo-3-chloropropane, 2-hexanone, 4-methyl-2-pentanone, and dichlorodifluoromethane exceeded the UCL in the MS/MSD analyses of sample 03.

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

Came out higher than the 0.4ppb. Maybe the instrument needed a run to equilibrate.
