Notes:

ANAC - anaerobic active control
ANSC - anaerobic sterile control
ND - not detected
mg/L - milligrams per liter
VFAs - total volatile fatty acids, calibrated as lactate but may include other VFAs such as formate, acetate, propionate, pyruvate and butyrate
< - compound not detected, the associated value is the detection limit

Notes:

ANSC - anaerobic sterile control
EZVI - emulsified zero valent iron
g - gram
ND - not detected
mg/L - milligrams per liter
VFAs - total volatile fatty acids, calibrated as lactate but may include other VFAs such as formate, acetate, propionate, pyruvate and butyrate
ZVI - zero valent iron
< - compound not detected, the associated value is the detection limit
-- - not analysed

Notes:

ANSC - anaerobic sterile control
EZVI - emulsified zero valent iron
g - gram
mg/L - milligrams per liter
ND - not detected
ZVI - zero valent iron
< - compound not detected, the associated value is the detection limit
-- - not analysed

APPENDIX B: Henry's Law Calculation

The following Henry's Law calculation was used to convert aqueous concentrations (Table 2) to total mmoles of each analyte per microcosm bottle:

$$Total\ mmoles = \frac{C_{liq} \cdot (V_{liq} + H \cdot V_{gas})}{Molecular\ Weight\ (\frac{mg}{mmol})}$$

Where

C_{liq} = liquid concentration (mg/L)
V_{liq} = liquid volume (0.200 L) per bottle
V_{gas} = headspace volume (0.025 L) per bottle
H = Henry's Law constant (dimensionless)

The Henry's Law constants used are summarized in the table below.

Analyte	Henry's Law Constant [a] (dimensionless)
Trichloroethene	0.417
cis-1,2-dichloroethene	0.184
trans-1,2-dichloroethene	0.386
1,1-dichloroethene	1.06
Vinyl chloride	1.08
Ethene	8.78
Ethane	20.5
Dichloromethane	0.121
Chloromethane	0.409
Methane	27.3

APPENDIX C: Microcosm and Reactor Amendments Information Sheets

WILCLEAR® LACTATE CONCENTRATE

PROVEN ELECTRON DONOR EFFICIENCY AND DECHLORINATION KINETICS AT A LOW COST

WILCLEAR® is a food grade 60% sodium or potassium lactate solution that has been deployed at U.S. Department of Energy sites and military installations, Superfund sites, mining sites, Brownfields, industrial sites, private chemical plants, and dry cleaners across North America and Europe. To date, WILCLEAR® has been used on over 250 projects in nearly every state in the US, including Hawaii and Alaska.

BENEFITS OF WILCLEAR®

- Provides carbon for rapid establishment of anaerobic conditions needed for reduction of nitrate, hexavalent chromium, perchlorate, and RDX.
- Miscibility in water and low viscosity allow for advective transport with groundwater; enhancing subsurface distribution and minimizing the number of injection points.
- Effective for both dissolved phase and DNAPL source area treatment.

RAPID DECHLORINATION KINETICS

Microcosm studies comparing WILCLEAR® to other soluble donors show that while all four donors stimulate complete dechlorination of PCE to ethene, WILCLEAR® and ethanol have the fastest dechlorination kinetics.

GREATER DONOR EFFICIENCY

Efficiency (amount of contaminant remediated per unit donor added) should be considered when determining donor cost performance. Of the three donors that show both complete dechlorination and reasonable remediation rates, lactate has the best efficiency.

TYPICAL PROPERTIES

- WILCLEAR® sodium lactate (% wt/wt): 60 ± 1.2
- pH: 7 ± 1.0
- Viscosity: 110cP at 20ºC
- Specific gravity: 1.32 – 1.35
- Soluble in water
- Color: clear to light straw

Safety Data Sheet

60% SRS®-SD Small Droplet Emulsified Vegetable Oil (EVO) Substrate for Maximum Radius of Influence

United States Patent #RE40,448

The anaerobic bioremediation process uses native or introduced microorganisms (*Dehalococcoides*) to degrade chlorinated solvents such as tetrachloroethene (PCE) and trichloroethene (TCE) to innocuous end products including ethene and ethane. Terra Systems patented **SRS®-SD** Small Droplet Emulsified Vegetable Oil Substrate includes a **nonionic emulsifier** (does not have a charge), which does not readily stick to soil particles and is specifically designed when maximum radius of influence in the formation is key to making contact with the bacteria. It is is added to the groundwater to rapidly generate reducing conditions and provide the necessary carbon and hydrogen to support biodegradation of the chlorinated solvents.

Table I: SRS®-SD Small Droplet Emulsified Vegetable Oil Substrate Specifications

Ingredient	Percent	Description	Benefit
Food Grade U.S. Grown Soybean Oil	60%	Terra Systems operates its own state-of-the-art manufacturing facility.	Long lasting slow release source of carbon and hydrogen, consistent product quality, uniform droplet size, neutral pH, QA/QC lab on floor to check product before shipment.
Food Grade Sodium or Potassium Lactate	4%	Rapidly biodegradable soluble substrate	Fast release source of carbon and hydrogen to rapidly generate anaerobic conditions
Proprietary Food Grade Nutrients	<1%	Proprietary organic and inorganic nutrients such as yeast extract, nitrogen and phosphorus.	Nutrients have been demonstrated to support the growth of the anaerobic microbial population.
Proprietary Food Grade Emulsifiers and Preservatives	7.5%	Proprietary nonionic emulsifier	Maximum radius of influence due to small droplet size and nonionic emulsifier in moderate to fine sand, silt and clay aquifers
Vitamin B_{12}	<1%	At least 250 µg/L of Vitamin B_{12}	He et al. 2007 demonstrated Vitamin B_{12} to be an important micronutrient to enhance dechlorination activity with 25 µg/L providing maximum stimulation
Median Oil Droplet Size (microns)	NA	0.6 µm	Maximum radius of influence due to small droplet size and nonionic emulsifier in moderate to fine sand, silt and clay aquifers
pH	6.5 - 7	6.5 - 7	Optimum microbial activity

Application: Terra Systems **patented**, nutrient enriched, proven slow release SRS®-SD **small droplet** emulsified vegetable oil substrate with a **nonionic emulsifier** is used when a long lasting carbon substrate is desired that provides maximum radius of influence in moderate to fine sand, silt and clay aquifers, which increases the distance between injection points and reduces the frequency of reinjection. The groundwater flow-rate is typically less than 180 feet/year. SRS®-SD does not stick to soil particles and is specifically designed when radius of influence in the formation is key to making contact with the bacteria.

Terra Systems INCORPORATED

Customers: SRS®-SD is used extensively by consultants working with current and former drycleaners, semiconductor plants and private firms and the Air Force, DOD, Navy, and EPA to cost effectively remediate chlorinated solvent sites. SRS®-SD releases bio-available hydrogen over a period of 3 to 5 years thus enhancing the long-term anaerobic biodegradation of the chlorinated solvents and reducing the frequency of reinjection.

Manufactured vs. Field Emulsion

In the early days of in-situ bioremediation when Terra Systems first patented the technology, it was common to bring the water, emulsifiers, oil, and other ingredients to the site and using trash or other pumps to mix the ingredients together to form an emulsion. It soon became apparent that poor emulsion consistency and a broad range of droplet sizes resulted in inadequate and uneven distribution when injected. This resulted in higher long-term costs due to higher reinjection frequency and higher substrate volumes to adequately make contact with the COC.

Don't be "***penny wise and pound foolish***".

Consider:

- ✓ The labor and equipment time and cost of mixing in the field.
- ✓ The need to mix the nutrients and Vitamin B_{12} longer to achieve consistency.
- ✓ The cost of inadequate distribution due to droplet size and emulsion inconsistency
- ✓ The inability to accurately determine if you have 100% emulsification.
- ✓ The lack of QA/QC in the field

- Terra Systems owns and operates a state of the art US based manufacturing plant with an in-house quality control laboratory for strict quality assurance of the emulsion, droplet size and pH.
- SRS®-SD arrives at the site "***injection ready***" with all the ingredients – Vitamin B_{12}, proprietary nutrients, sodium or potassium lactate and anionic emulsifier(s) already blended together.
- At the PM's request Terra Systems will blend 2-8 g/L of sodium bicarbonate into the SRS®-SD during manufacturing to counter the acids produced during the fermentation process in the aquifer. This is especially beneficial for marginal pH aquifers of pH 5 – 6.

A Digital Microscope is connected to a laptop computer with proprietary "***Droplet Size Calculation Software***" which allows us to calculate the "***mean***" droplet size for each batch of SRS®-SD before transferring to a bucket, drum, tote or tanker for shipment to the customer

130 Hickman Road – Suite 1 – Claymont – Delaware – 19703

Terra Systems
INCORPORATED

- SRS®-SD optimizes the naturally occurring biodegradation system by supplying the rate limiting factor (in this case hydrogen) in the degradation of CVOC's, certain pesticides/herbicides, perchlorate, and immobilization of certain metals (hexavalent chromium, molybdenum, selenium, and some radionucleides).
- The **small droplet size** of **0.6 µm** combined with the **neutral surface charge** on the droplets results in a higher radius of influence in the subsurface.
- Terra Systems holds United States Patent #**RE40,448** for the use of emulsified vegetable oil for remediation of chlorinated solvents.
- The soy bean oil is grown in the United States and provides a **slow release** biodegradable carbon source, which promotes long-term biological activity.
- SRS®-SD comes **standard** with **biostimulating vitamins** like Vitamin $B_{12,}$ which He et al. 2007 demonstrated is an important micronutrient to enhance dechlorination activity.
- SRS®-SD contains proprietary organic and inorganic nutrients such as yeast extract, nitrogen and phosphorus, which have been demonstrated to support the growth of the anaerobic microbial population.
- SRS®-SD comes with **at least 4% sodium** or **potassium lactate** a quick release biodegradable substrate, which helps to "*jump start*" bacterial growth.
- SRS®-SD emulsified vegetable oil substrate has been validated by the Florida DEP, California Water Board and others.
- SRS®-SD contains only non-toxic food grade materials, which results in green, sustainable remediation.

Packaging: Terra Systems patented SRS®-SD can be shipped in 5-gallon buckets, 55-gallon drums, 275-gallon IBC totes, 275-gallon cardboard totes or bulk tankers.

If the *Dehalococcoides* are not present or are in small numbers Terra Systems **TSI DC®** Bioaugmentation Culture can also be injected.

130 Hickman Road – Suite 1 – Claymont – Delaware – 19703

Emulsified Zero-Valent Iron (EZVI)

Emulsified Zero-Valent Iron (EZVI) is a water in oil emulsion consisting of nano/micro scale zero-valent iron, surfactant, food grade vegetable oil, and water that reductively dehalogenates halogenated hydrocarbons (e.g. PCE, TCE, CFC, VC). EZVI uses a patented micellular structure to deliver reactive iron which mimics the physical chemistry of DNAPL. It has the ability to mix with DNAPLs present in the subsurface environment. Thus, EZVI is a "source area" remediation technology.

TEA is the largest custom manufacturer/supplier of EZVI, providing reactive, stable emulsions since 2005. TEA's EZVI products have been utilized at multiple locations across the United States as well as internationally.

EZVI AWARDS:

- **2007 - Induction into the NASA's Space Technology Hall of Fame**
- **2006 - Excellence in Technology Transfer awarded by Federal Laboratory Consortium (FLC)**
- **2005 - Awarded Governmental Invention of the Year by NASA**
- **2005 - Awarded Commercialization Invention of the Year by NASA**

ADVANTAGES AND BENEFITS

- Developed/patented by NASA
- Field-tested by the U.S. EPA under the SITE Program
- Primarily used for in-situ DNAPL source area destruction
- Typical source concentration decrease ~90+% within 3 months
- Surfactant-stabilized water-in-oil emulsion with zero-valent iron particles
- Hydrophobic, dense emulsion absorbs DNAPL, delivering contaminant to iron
- In-situ chemical reduction of chlorinated solvent to ethene and water
- Injection or soil mixing using conventional technologies
- Does not promote mobilization of DNAPL

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried
THM-SUM-CALC-WT	Soil	Total Trihalomethanes (THMs)	CALCULATION
Total Trihalomethanes (THMs) represents the sum of bromodichloromethane, bromoform, chlorodibromomethane and chloroform. For the purpose of calculation, results less than the detection limit (DL) are treated as zero.			
TOC-WT	Soil	TOC & FOC in Solids	CARTER 21.2
VOC-ROU-HS-WT	Soil	Volatile Organic Compounds	SW846 8260
Soil and sediment samples are extracted in methanol and analyzed by headspace-GC/MS.			
XYLENES-SUM-CALC-WT	Soil	Sum of Xylene Isomer Concentrations	CALCULATION
Total xylenes represents the sum of o-xylene and m&p-xylene.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

SPECIAL INSTRUCTIONS/COMMENTS

THE QUESTIONS BELOW MUST BE ANSWERED FORWATER SAMPLES (CHECK Yes OR No)

Are any samples taken from a regulated DW System? Yes ___ No ___

If yes, an authorized drinking water COC MUST be used for this submission.

Is the water sampled intended to be potable for human consumption? Yes ___ No ___

SAMPLE CONDITION

___ FROZEN
___ COLD
✓ COOLING INITIATED
___ AMBIENT

MEAN TEMP: 1.0

SAMPLED BY: Michael Healey	DATE & TIME: 14 May 14 09:00	RECEIVED BY:	DATE & TIME
RELINQUISHED BY: Michael Healey	DATE & TIME: 14 May 14 10:30	RECEIVED AT LAB BY: MK	DATE & TIME: 14 MAY 14 16:10

OBSERVATIONS Yes___ No ___ If yes add SIF

INIT: MK

Notes

1. Quote number must be provided to ensure proper pricing

2. TAT may vary dependent on complexity of analysis and lab workload at time of submission. Please contact the lab to confirm TATs.

3. Any known or suspected hazards relating to a sample must be noted on the chain of custody in comments section.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects.
R	The ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
CAN-DATA-WT	Canister	Canister Information	EPA TO-15A
VOC-GCMS-WT	Canister	Volatile Organic Compounds	EPA TO-15

This analysis is performed using procedures adapted from EPA Method TO-15. Air samples are collected into cleaned evacuated canisters. A volume of air sample is transferred from the canister to a preconcentrator system where the analytes are trapped & focused. The analytes are then thermally desorbed into a GC-MSD for analysis. Test results are not blank corrected unless indicated by a qualifier.

This analysis was performed under AIHA-IHLAP Scope of Accreditation, GC/MS Field of Testing which is compliant with AIHA-LAP, LLC Accreditation Policy Modules & ISO/IEC 17025:2005 Standard.

Canister samples will be retained for 7 calendar days after final report. If you require a longer canister storage time, please contact your account manager.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Methodology

Product	Matrix	Product Description	Analytical Method Reference
CAN-DATA-WT	Canister	Canister Information	EPA TO-15A
PREP-CANISTER-WT	Canister	Canister Prep Charge	EPA TO-15
SAMPLE-DISPOSAL-WT	Misc.	Sample Handling and Disposal Fee	
VOC-GCMS-WT	Canister	Volatile Organic Compounds	EPA TO-15

This analysis is performed using procedures adapted from EPA Method TO-15. Air samples are collected into cleaned evacuated canisters. A volume of air sample is transferred from the canister to a preconcentrator system where the analytes are trapped & focused. The analytes are then thermally desorbed into a GC-MSD for analysis. Test results are not blank corrected unless indicated by a qualifier.

This analysis was performed under AIHA-IHLAP Scope of Accreditation, GC/MS Field of Testing which is compliant with AIHA-LAP, LLC Accreditation Policy Modules & ISO/IEC 17025:2005 Standard.

Canister samples will be retained for 7 calendar days after final report. If you require a longer canister storage time, please contact your account manager.

LABORATORY REPORT

December 12, 2014

Linda Raabe
AECOM
112 E. Pecan Street Suite 400
San Antonio, TX 78205

RE: LHAAP-18-24

Dear Linda:

Enclosed are the results of the samples submitted to our laboratory on December 2, 2014. For your reference, these analyses have been assigned our service request number P1404902.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

Kate Aguilera

Client: AECOM
Project: LHAAP-18-24

Service Request No: P1404902

CASE NARRATIVE

The samples were received intact under chain of custody on December 2, 2014 and were stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Fixed Gases Analysis

The headspace of each of the samples were analyzed for fixed gases (hydrogen, oxygen/argon, nitrogen, carbon monoxide, methane and carbon dioxide) according to modified EPA Method 3C (single injection) using a gas chromatograph equipped with a thermal conductivity detector (TCD). This procedure is described in laboratory SOP VOA-EPA3C. This method is not included on the laboratory's NELAP or AIHA-LAP scope of accreditation.

The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.

Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.

MyiQ-DB-DHC-QPCR-0473
iQ5-TBA-QPCR-0047

Table 1a: Test Results

Customer Sample ID	SiREM Sample ID	Sample Collection Date	Sample Matrix	Percent Dhc *	*Dehalococcoides* Enumeration/Liter **
LHAAP-18/24-MW2A	DHC-10451	14-May-14	Microcosm	NA	9×10^4 U
LHAAP-18/24-MW2B	DHC-10452	14-May-14	Microcosm	NA	9×10^4 U
LHAAP-18/24-MW21A	DHC-10453	14-May-14	Microcosm	0.00004 - 0.0001 %	3×10^4 J
LHAAP-18/24-MW21B	DHC-10454	14-May-14	Microcosm	NA	9×10^4 U

Notes:

* Percent *Dehalococcoides* (Dhc) in microbial population. This value is calculated by dividing the number of Dhc 16S ribosomal ribonucleic acid (rRNA) gene copies by the total number of bacteria as estimated by the mass of DNA extracted from the sample. Range represents normal variation in Dhc enumeration.

** Based on quantification of Dhc 16S rRNA gene copies. Dhc are generally reported to contain one 16S rRNA gene copy per cell; therefore, this number is often interpreted to represent the number of Dhc cells present in the sample.

J The associated value is an estimated quantity between the method detection limit and quantitation limit.
U Not detected, associated value is the quantification limit.
B Analyte was detected in the method blank within an order of magnitude of the test sample
NA Not applicable as *Dehalococcoides* not detected and/or quantifiable DNA not extracted from the sample.
I Sample inhibited the test reaction based on inability to PCR amplify extracted DNA with universal primers.
E Extracted genomic DNA was not detected in sample.

SiREM Technical Note 1.5:

Guidelines for Interpretation of Gene-Trac® Test Results

This document provides technical background information and guidelines for interpreting the results for the following Gene-Trac® assays:

(1) Gene-Trac® Dhc
(2) Gene-Trac® VC
(3) Gene-Trac® Dhb

SiREM Technical Note 1.4 - *Quantitative Gene-Trac® Assay Test Procedure and Reporting Overview* provides detailed information on Gene-Trac® test procedures and reporting. Explanation of data qualifiers and commonly used notes is provided as Appendix A. Table 1 provides a brief interpretation for some common scenarios, more detailed interpretation information is provided in the following sections.

Table 1: Common Gene-Trac® Test Result Scenarios and Interpretation

Gene-Trac® Dhc (*Dehalococcoides*)	Gene-Trac® VC (*vcrA*)	Gene-Trac® Dhb (*Dehalobacter*)	Interpretation
>1 x10^7/L	**>1 x10^7/L**	Not Analyzed	Complete dechlorination to ethene likely as Dhc high and *vcrA* high
1 x10^7/L	**Not Detected**	Not Analyzed	VC accumulation possible as *vcrA* negative
Not Detected	**Not Detected**	Not Analyzed	Dhc negative/ lack of dechlorination or *cis*-DCE accumulation likely
Not Analyzed	Not Analyzed	**1 x10^6/L**	Dhb positive,potential for biodegradation of 1,1,1-TCA, 1,2-DCA, carbon tetrachloride and chloroform, PCE and TCE to *cis*-DCE
Not Analyzed	Not Analyzed	**Not Detected**	Biodegradation of 1,1,1-TCA, carbon tetrachloride and chloroform not expected as Dhb negative

Gene-Trac® Dhc -Total *Dehalococcoides* Test

Background:

Gene-Trac® Dhc is a quantitative PCR (qPCR) test for total *Dehalococcoides* (Dhc) microbes that targets Dhc specific sequences of the 16S ribosomal ribonucleic acid (rRNA) gene, a gene commonly used to indentify microbes. Dhc are the only known microorganisms capable of complete dechlorination of chloroethenes (i.e., tetrachloroethene, trichloroethene, cis-1,2-dichloroethene [cis-DCE] and vinyl chloride) to non-toxic ethene. Gene-Trac® Dhc may also be used to assess the in situ growth of Dhc containing bioaugmentation cultures such as KB-1®.

Negative Gene-Trac® Dhc Test Results (U qualified)

A non-detect in the Gene-Trac® Dhc assay (e.g., 4,000U) indicates that Dhc were not detected in the sample. The absence of Dhc is frequently associated with a lack of complete dechlorination or incomplete dechlorination of chlorinated ethenes. Where Dhc are absent the accumulation of cis-DCE is commonly observed, particularly after addition of electron donors. Bioaugmentation with Dhc containing cultures, such as KB-1®, is commonly used to improve bioremediation performance at sites that lack an indigenous Dhc population.

Positive Gene-Trac® Dhc Test Results

The detection of Dhc has been correlated with the complete biological dechlorination of chlorinated ethenes to ethene at contaminated sites (Hendrickson et al., 2002). A positive Gene-Trac® Dhc test indicates that Dhc DNA was detected in the sample and is encouraging for dechlorination of chlorinated ethenes to ethene. Note not all Dhc are capable of conversion of vinyl chloride to ethene; this capability can be determined by the Gene-Trac® VC test (see Section 2) which is commonly performed as a follow-on analysis after positive Gene-Trac® Dhc tests. In most cases Dhc must be present at sufficient concentrations in order for significant dechlorination to be observed, guidelines for expected impacts at various Dhc concentrations are indicated below.

Values of 10^4 Dhc gene copies per liter (or lower): indicates that the sample contains low concentrations of Dhc which may indicate that site conditions are suboptimal for high rates of dechlorination. Increases in Dhc concentrations at the site may be possible if conditions are optimized (e.g., electron donor addition).

Values of 10^5-10^6 Dhc gene copies per liter: indicates the sample contains moderate concentrations of Dhc which may, or may not, be associated with observable dechlorination activity (i.e., detectable ethene).

Values at or above 10^7 Dhc gene copies per liter: indicates that the sample contains high concentrations of Dhc that are often associated with high rates of dechlorination (Lu et al., 2006) and the production of ethene.

Values of 10^9 Dhc gene copies per liter are generally the highest observed for groundwater samples with rare exceptions.

Gene-Trac® VC- Vinyl Chloride Reductase (*vcrA*) Test

Background

Gene-Trac® VC is a qPCR test for the vinyl chloride reductase (*vcrA*) gene that codes for a Dhc enzyme that converts (VC) to ethene, a critical step in reductive dechlorination of chlorinated ethenes. Gene-Trac® VC is commonly used where Gene-Trac® Dhc test results are positive to confirm that the Dhc detected are capable of complete dechlorination to ethene.#

The vinyl chloride reductase gene (*vcrA)* (Müller et al., 2004) produces an enzyme that is found in many (but not all) Dhc and is reported to be the most common identified VC reductase in the environment (van der Zaan et al., 2010).

Key activity of vinyl chloride reductase vcrA gene/enzyme

Interpretation of Gene-Trac® VC Results

Detect in Gene-Trac® VC Test

A detect in the Gene-Trac® VC test indicates that a Dhc population has the *vcrA* gene and the prospects for complete dechlorination to ethene are good. As a minimal requirement, *vcrA* copies exceeding 10^5/L combined with observed increases over time (i.e., cell growth) are required for robust VC dechlorination (van der Zaan et al., 2010). Also the guidelines for detection of ethene provided under Gene-Trac® Dhc are conservative for interpretation of Gene-Trac® VC (i.e., > 1 x10^7 gene copies/L indicate a high likelihood of detection of ethene). In one study, more than 90% of samples where *vcrA* enumeration exceeded 1 x10^7 gene copies/L had detectable ethene (Dennis, 2009). In cases where *vcrA* gene copies are lower the likelihood of detectable ethene decreases.

Non-Detect in Gene-Trac® VC Test (U qualified)

A non-detect in the Gene-Trac® VC test indicates that *vcrA* gene sequences in the sample are below the detection limit of the assay (typically 4 x 10^3 *vcrA* gene copies/L). This indicates VC accumulation (VC stall) is possible. Note negative Gene-Trac® VC test results do not indicate with 100% certainty that a VC-stall will occur as there are other vinyl chloride reductase genes, such as *bvcA* (van der Zaan et al., 2010) that also convert VC to ethene.

Comparing Gene-Trac® VC and Gene-Trac® Dhc Test Results

Sites may contain different types of Dhc populations. At some sites the Dhc population is homogenous while other sites have Dhc populations that are mixtures of different types of Dhc. This can lead to differing results for Gene-Trac® Dhc and Gene-Trac® VC.

In many cases, the numerical results of Gene-Trac® VC test are identical to those obtained in the Gene-Trac® Dhc test, indicating that the entire Dhc population contains the *vcrA* gene. In other cases, Gene-Trac® VC results may differ significantly (i.e., more than an order or magnitude) from the total Dhc for a number of reasons.

Table 3 provides some common scenarios for Gene-Trac® VC and Gene-Trac® Dhc test results. In general, where Gene-Trac® VC results are non-detect, or significantly lower than Gene-Trac® Dhc, accumulation of VC is more likely.

Table 2: Interpretation of Gene-Trac® VC in Relation to Gene-Trac® Dhc

Gene-Trac® Dhc (16S rRNA gene copies/ L)	Gene-Trac® VC (*vcr*A gene copies/L)	Results Summary	Interpretation	Potential Site Implications
2×10^8 /L	3×10^8/L	Total Dhc and *vcrA* are ~the same (within 3-fold)	Entire Dhc population has *vcrA* gene	Potential for complete dechlorination high. VC stall unlikely-sites with *vcr*A above 1×10^7/L typically have detectable ethene
1×10^8/L	Non-detect	Total Dhc high; *vcrA* non-detect	High concentration of Dhc and entire population lacks the *vcrA* gene	Likelihood for VC accumulation high as *vcrA* non-detect
1×10^8/L	1×10^6 /L	Total Dhc is significantly higher (100 fold) than *vcrA*	*Dhc* population consists of different types, some with the *vcrA* gene (~1%) and some without (~99%)	VC-accumulation possible; Dhc/*vcrA* proportions may change over course of remediation
1×10^6/L	1×10^8/L	*vcrA* orders of magnitude higher than Dhc	Significantly higher *vcrA* may indicate the presence of populations of non-Dhc microorganisms with *vcrA* like genes	Potential for VC-stall likely low

Gene-Trac® Dhb-Total *Dehalobacter* Test

Gene-Trac® Dhb is a qPCR test targeting the 16S rRNA gene sequences unique to *Dehalobacter* (Dhb). Dhb are implicated in the biodegradation of 1,1,1-trichloroethane (to chloroethane), 1,1,2-trichloroethane and 1,2-dichloroethane to ethene (Grostern and Edwards, 2006) and chloroform (to dichloromethane) (Grostern et al., 2010) as well as incomplete dechlorination of PCE and TCE to cis-DCE (Holliger et al.,1998). Gene-Trac® Dhb may also be used as a tool to assess the impact of bioaugmentation with the KB-1® Plus cultures which contain high concentrations of Dhb.

Positive Gene-Trac® Dhb Test Results (Detects)

A positive Gene-Trac® Dhb indicates that a member of the *Dehalobacter* (Dhb) genus was detected in the sample. The detection of Dhb indicates that some or all of the dechlorination activities attributed to Dhb may be present at the subject site. Increasing concentrations of Dhb are indicative of increased potential to degrade some or all of these compounds.

Note: the Gene-Trac® Dhb test will not differentiate the type of Dhb*;* therefore, observations of the specific biodegradation pathways and end products based on chemical analytical methods in conjunction with Gene-Trac® Dhb will increase the interpretability of Gene-Trac® Dhb results.

Note: Dhb have been reported to contain multiple copies (up to 4 per cell) of the 16S rRNA gene (Grostern and Edwards, 2008). This means that, unlike Dhc, there is not a 1:1 ratio between the 16S rRNA gene copy and the number of Dhb cells in a sample. Calculating the number of Dhb cells requires dividing the Gene-Trac® Dhb test result by the 16S rRNA gene copy number (often 3-4 copies/cell).

Non-detect Gene-Trac® Dhb Results (U qualified)

In cases where Gene-Trac® Dhb is not detected (e.g., 4,000U) this indicates that *Dehalobacter* species were not identified in the sample and that anaerobic reductive dechlorination of 1,1,1-TCA, 1,1,2-TCA, 1,2-DCA or chloroform, which are dechlorinated by *Dehalobacter*, may not be observed. This activity can be introduced at sites through the addition of bioaugmentation cultures containing *Dehalobacter* such as KB-1® Plus.

Key Elements of Gene-Trac® Data

Gene-Trac® test results include two key values (a) Target Gene Enumeration, an enumeration of target gene sequence by quantitative PCR (e.g. "Dhc Enumeration" "Dhb 16S Gene Copies" or "*vcrA* gene copies") and (b) Target gene percent (e.g. "Percent Dhc"), an estimated percentage of the microbial population comprised by microbes harboring the target gene and other microbes present in sample. Further explanation of these values is provided below.

a) Target Gene Enumeration

This value is the concentration of Dhc or Dhb 16S rRNA or *vcrA* gene copies detected in the sample. Results may be reported as either gene copies per liter (for groundwater) or per gram (for soil). In general, the greater the number of gene copies in a sample the greater the likelihood of related dechlorination activity. Dhc 16S gene copies are typically equivalent to the number of Dhc as they have 1 gene copy per cell this is not necessarily true for Dhb or *vcrA* which have the potential be present in multiple gene copies per cell. Guidelines for relating target gene presence and concentration to observable dechlorination activity for groundwater samples are provided below in previous sections.

b) Target Gene Percent (%Dhc, %Dhb, %*vcrA*)

This value estimates the percentage of the target gene (e.g., %Dhc) relative to other microorganisms in the sample based on the formulas/assumptions presented below. For example, %Dhc is a measure of the predominance of Dhc and, in general, the higher this percentage the better.

$$\%Dhc = \frac{\text{Number Dhc}}{\text{Number Dhc} + \text{Number other Bacteria}}$$

Where:

$$\text{Number other Bacteria} = \frac{\text{Total DNA in sample (ng)} - \text{DNA attributed to Dhc (ng)}}{*4.0 \times 10^{-6}\ \text{ng DNA per bacterial cell}}$$

*Paul and Clark, (1996).

Percent Dhc (and % *vcrA*) values can range from very low fractions of percentages, in samples with low numbers of Dhc and a high number of other bacteria (incompletely colonized by Dhc), to greater than 50% in Dhc enriched locations (highly colonized by Dhc).

In addition to determining the predominance of the target gene target gene percent is also useful for interpretation of Dhc counts from different sampling locations, or the same location over time. For example, the %Dhc value can be used to correct Dhc counts where samples are biased due to non-representative sampling. Example 1 illustrates a hypothetical scenario where the %Dhc value improved data interpretation.

Example 1, use of %Dhc to interpret enumeration data

Table 2 presents results from MW-1 sampled in April, May and June. Based on the Dhc enumeration alone one would conclude that the concentration of Dhc held steady between April and May; however, the %Dhc indicates the proportion of Dhc actually increased from April to May and the unchanged count in May could be a case of low biomass recovery during sampling or other losses such as sample degradation in transit. The higher raw count and the higher percentage of Dhc in June confirm the trend of increasing Dhc concentrations over time.

Table 3: Use of % Dhc* Value to Diagnose Sampling Bias

Sample	Dhc Enumeration	%Dhc	Interpretation Based on %Dhc
MW-1, April	1.0×10^5/Liter	0.1%	Dhc is a low proportion of total microbial population
MW-1, May	1.0×10^5/Liter	1%	Dhc proportion increased 10-fold from April. Dhc enumeration was unchanged possibly due to low biomass recovery from monitoring well, non-biased sample would be $[(1.0/0.1) \times 1.0 \times 10^5] = 1.0 \times 10^6$/Liter
MW-1, June	1.0×10^7/Liter	10%	Dhc has increased 100-fold from April and confirms May sample was likely low biased

**Note: the above approach is also applicable to the "%vcrA" and "%Dhb" values provided on their respective test certificates*

Appendix A: Data Qualifiers

Data Qualification

Data qualifiers and notes are used to clarify Gene-Trac® test results. Additional explanation beyond that provided on the test certificate is provided below.

"**U" Not detected, associated value is the quantitation limit.** Indicates that the target gene (microbe) was not detected in the sample above the quantitation limit of the assay. Note the quantitation limit value can change between samples as the volume filtered can vary; thus, a sample in which 100 ml was tested would have a 5–fold higher quantification limit compared with a sample in which 500 ml was tested.

"J" The associated value is an estimated quantity between the method detection limit and quantitation limit. Indicates that the target gene was conclusively detected but the concentration is below the quantitation limit where it cannot be accurately quantified.

"I" Sample inhibited the test reaction. This means universal primers were incapable of amplifying DNA from this sample. The inability to amplify with universal primers suggests that the sample may be imparting matrix interference. Matrix interference is commonly attributed to humic compounds, polyphenols and metals. Non-detects with an "I" qualifier are more likely to be false negative.

"B" Analyte was also detected in the method blank. Indicates that DNA was detected in a method blank or negative control; detectable contamination of the blanks with microbes or DNA containing the gene of interest is not uncommon as the test reaction is extremely sensitive. In most cases, blank contamination is at a very low level relative to test results (often orders of magnitude lower). In these cases, blank contamination is not relevant to interpretation of test results. The potential of test samples being contaminated (i.e. false positives) should be considered in cases where blank results are within 1 order of magnitude of test results.

Subject: Soil Resistivity Report
Long Horn Army Plant 18-24

Dear Mr. Salameh,

TRS Group received 6 soil samples from the Long Horn Army Plant 18-24 on June 3, 2014 for soil resistivity testing per ASTM Method G187-12a. The soil samples were received inside 8-ounce glass jars and were packaged on ice inside a cooler. A chain-of-custody was included with the samples and is provided as Attachment A to this document. The sample labels and descriptions were as follows:

- Sample 18CPTUEP09 (34-35)300514 – Brown clayey sand
- Sample 18CPTUEP09 (27-28)300514 – Brown sand
- Sample 18CPTUEP11 (25-26)310514 – Brown sand
- Sample 18CPTUEP11 (45-46)310514 – Gray clay
- Sample 18CPTACD07 (15-16)020614 – Gray silt
- Sample 18CPTACD07 (27-28)020614 – Gray clay with solvent odor

The soil samples were subjected to resistivity testing using the two-electrode soil box method outlined in ASTM G187-12a. The testing was performed at several different voltage levels in the range of 20 to 130 volts. In this testing, the true soil resistivity is approached as voltage levels are increased. The results of the testing are provided below in Tables 1 through 6.

SUMMARY OF RESULTS

The resistivity tests show that the soil resistivity for samples fall into the range of 15 to 35 ohm-m which is highly typical for these types of soil. There was little variability in soil resistivity as a function of depth. Soil with this resistivity value is very amenable to ERH. The soil resistivity values suggest that an ERH system for this project would operate in the range of 100 to 200 volts during operations with a current draw in the range of 2 to 4 amps per linear foot of electrode.

We appreciate to opportunity to work with you on this project. If you have any questions please feel free to contact me at (419) 517-3649.

Sincerely,
TRS Group, Inc.

Daniel Oberle, P.E.
VP – Engineering

Re: Draft Final 1st Annual Remedial Action Operation Report for LHAAP-67, Above Ground Storage Tank Farm at Longhorn Army Ammunition Plant, Karnack, Texas

Dear Mr. Mayer,

The above-referenced document is being transmitted to you for your records and includes revisions based upon your comments on the Draft. In accordance with the FFA, the Draft Final will be considered Final after 30 days without further comment.

The document was prepared by AECOM on behalf of the Army as part of AECOM's Performance Based Remediation contract for the facility. I ask that Debra Richmann, AECOM's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

Draft 1st Annual Remedial Action Operation Report for Site LHAAP-67 (Above Ground Storage Tank Farm)
Longhorn Army Ammunition Plant, Karnack, Texas

November 2016

Reviewer: Richard Mayer, EPA

Respondent: Debra Richmann, AECOM

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1	iii	Minor Editorial Comment	Please move micrograms per liter at the top of page to the location of "milligrams per liter", so the abbreviations are in alphabetical order.	C	The acronym "µg/L -micrograms per liter" has been moved as requested.	
2	2-2	Last Full Paragraph	Please add Shaw, 2011 reference to reference list. Please also add RD to the acronyms and abbreviation list.	C/E	The Shaw, 2011 reference has been added to reference list on page 5-1 of the draft report. Since the abbreviation for Remedial Design (RD) was only used once in the report, it has been removed from Section 2.2.2 instead of adding it to the acronyms abbreviation list.	
3	2-3	Minor Editorial Comment	There is a reference to EPA, 2014 in this section. In the reference section, EPA and USEPA are used. EPA recommends changing the EPA, 2014 reference to USEPA to be consistent.	C	EPA has been changed to USEPA as requested in both locations, and anywhere else it occurs in the document. The definition, U.S. Environmental Protection Agency, has also been inserted in second line of Section 2.2.1.	
4		Figure 2-3	The groundwater flow direction in the text and the flow lines shown on the map indicates a northerly/northeast flow. Based on the data for this map, it appears to be several flow directions, including east and even southeast, dependent on where you look at on the contour map. The lack of water level data to the north indicates a gap in water levels. EPA would not consider the flow to be predominantly north based on what is shown on this map. In addition, the plume orientation appears to be more of a west to east direction which is odd.	C	With monitoring wells 67WW03 being dry at the time of the gauging event and the 67WW12 groundwater elevation considered an outlier, agree that a data gap exists in the north. The text in Section 2.2.2 has been changed to indicate that based on these considerations, the interpreted flow directions may vary from east, to northeast, and north. Figure 2-3 has been revised to account for this information.

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
5		Figure 2-7	The monitoring well groundwater elevations are not shown on the figure, please include them.	D	It is assumed this comment refers to Figure 2-6. Figure 2-6 was modified from Figure 2-4 in the Final Remedial Design (Shaw, 2011), which shows the groundwater surface elevation contours, based on December 2007 measurements. However, that source figure does not include the groundwater surface elevations for the individual wells. Please note that in response to a TCEQ comment, Figure 2-6 has been re-named "Historical Shallow Zone Groundwater Gradient Map".	
6	3-1	Monitoring Well 67WW01	The text states "Concentrations of 1,1-DCE (degradation product of 1,1,1-TCA) and 1,2-DCA (degradation product of 1,1,2-TCA) have generally remained stable over the last year with slight increase observed in May 2014, but significantly lower than the 1998 levels." When using the phrase significantly lower than the 1998 levels, this would suggest a statistical analysis which is not the case here. Suggest rephrasing. In addition, Figure 2-11 is a times-series plot over just a few data points, so the use of the word trend may make a person believe this is statistically valid trend. Also, please include the 1998 levels in the text or in a table, so the reader can see the difference.	C/E	The word "statistically" has been changed to "considerably" in Section 3.1, Well 67WW01. Similarly, Figure 2-11 has been renamed, "COC Concentration and Groundwater Elevation Evaluation". Historical COC concentrations, including those from 1998, are included in Table 2-3. A reference to this table has been added to the first paragraph in Section 3.1.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
7	3-1	Monitoring Well 67WW03	Figure 2-11 does not include a water level or screened interval data for the time period. Please add to the figure or clarify why it cannot be included on the figure. Based on the data presented in figure 2-11, the water level within the screen is important, as you can see changes in concentration on the other figures with screen saturation. Typically, in these graphs, you see a lower concentration with less saturated screen thickness. Also, EPA is perplexed on what is being attributed to MNA from 1,800 ug/l for 1,1,1, TCA in 1998 to non-detect in 2004, this does not seem practical based on changes in other wells. EPA recommends trying to verifying the initial value of 1,800 ug/l to see if that was a "real" value and if it is a real value then try to determine if it is possible for a concentration of 1,800 ug/l to attenuate in a six year period.	C	Historical water level data for 67WW03, predating 2007, were noted on Figure 2-11 as not available; however, a groundwater elevation for the September 12, 2004 sampling event was found in the *Final Data Gaps Investigation Report, Longhorn Army Ammunition Plant, Karnack,* Texas, prepared by Shaw (April 2007). Figure 2-11 has been revised to include this groundwater elevation, and the screened interval for 67WW03 has been added to the graph. Note that 67WW03 was dry and could not be sampled during the four quarterly sampling events during the Year 1 RA(O) monitoring period; however, based on Table 2-1, enough water was present in 67WW03 during the May 2013 event to obtain a water level measurement. Therefore, the May 2013 groundwater elevation was also added to the 67WW03 graph on Figure 2-11. The text concerning the COCs reported in 67WW03 in 1998 has been changed to indicate "the initially reported concentrations are suspect and/or not representative of the shallow zone groundwater." The second to last sentence has been modified as follows: "Because this well has been chronically dry, it was replaced by adjacent well 67WW12, which is screened over an interval that is approximately 10 feet deeper than well 67WW03."

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
8	3-2	Section 3.1.1, Second Sentence	The flow direction over the quarterly samplings seems to vary in direction depending on where one considers drawing a flow path. The plume appears to be in a more northwest to east/southeast orientation. As stated before, this seems very odd. EPA recognizes that some additional wells have been installed at the site and future reports may indicate a more consistent flow direction and a better defined plume.	--	Noted. "variable" has been inserted in the third sentence of the section to acknowledge the groundwater flow directions can be interpreted differently, depending on the flow path.	
9	3-3	Third Paragraph	This comment is related to comments number 5 and 6 in regards to concentration and saturated thickness of a well screen. EPA definitely appreciates the efforts to look for a relationship between water level elevation and concentrations. However, at this point there are only a few points to use for correlation, so is the sample size large enough to be statistically valid? Over time, when there is more data, the correlation calculations may be more useful. Also, please include a table or appendix with the calculations. Also, there could be other factors involved such as such as low-flow purged samples verses bailed samples.	C	The supporting documentation for the correlation coefficients are provided in Appendix E.	
10	3-5	Fifth Paragraph, Minor Editorial Comment	Please change monitoring well 67W08 to 67WW08.	C	Text changed as requested.	
11	5-1	References	EPA could not locate USACE, 2011 reference in text. Please remove if not used in text.	C	Reference has been removed.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1	2-3	Section 2.3	Second paragraph could also note that plume is delineated within the LUC boundary and not near surface water body.	C	The following text has been added before the last sentence in the second paragraph: "Further, the VOC plume is delineated within the LUC boundary and is not near any surface water body."	
2		Figures 2-2 through 2-6	The groundwater gradient is pretty flat at this site with generally less than 1 foot change across the site. There really are not enough data points to justify the o.1 foot contours and the extra lines really don't add information. Such small variations could be related to well development, screening, or smearing. I request again that we not contour more often than every 0.5 foot. The contours should be at XXX.0 and XXX.5 (not XXX.45 as on Figure 2-4). 2-3 – Revise note 2 "appears to be an outlier" not "on" 2-6 – Has no elevations. Change title to add "Historic Groundwater Gradient" or similar.	C/D	Because of the very low relief and number of control points at the site, re-contouring the potentiometric surface figures at a 0.5 ft contour interval would not add any value (only one or possibly two contour lines would be shown per figure). Note 2 on Figure 2-3 has been corrected to say "appears to be an outlier." The title on Figure 2-6 has been changed to, "Historical Shallow Zone Groundwater Gradient Map", because AECOM Figure 2-6 was modified from Figure 2-4 in the Final Remedial Design (Shaw, 2011), which did not include groundwater elevations for the individual wells.	
3	3-1	Section 3.1	Well 67WW03 – the absence of COCs is not likely from natural attenuation. This well is screened higher than the wells that produce water and contain site COCs. Please revise assertion.	C	The text concerning the COCs reported in 67WW03 in 1998 has been changed to indicate "the initially reported concentrations are suspect and/or not representative of the shallow zone groundwater." The second to last sentence has been modified as follows: "Because this well has been chronically dry, it was replaced by adjacent well 67WW12, which is screened across an interval that is approximately 10 feet deeper than well 67WW03."

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
4	3-2	Section 3.1	Wells 67WW09 and 67WW11 – Please provide a better explanation as to why these wells were not sampled in May 2014. Well 67WW09A serves to monitor LUC boundary, not plume extent.	C	In the text of Section 3.1, under wells 67WW09 and 67WW11, the following will be inserted after "May 2014" in the second sentence (note that the well ID number will correspond to the well that is being described in that particular section): "Well 67WW09 [or well 67WW11] was not sampled in May 2014, because a monitoring well adjustment plan that was submitted to the regulators in April 2014, with a recommendation to remove well 67WW09 [or well 67WW11] from sampling. It was assumed that the adjustment plan would be approved. However, it was not until the November 2014 monthly managers' meeting that all parties agreed to hold off on any changes to the monitoring network until a year of data from the existing well network was obtained. For this reason, well 67WW09 [or well 67WW11] was not sampled in May 2014. Another well, 67WW09A, was installed upgradient of the plume and serves to define the south LUC boundary.	
5	3-2	Section 3.1.1	First paragraph – Several of these edits also relate to copied text in Section 4, 4-1, second paragraph Sentence three seems to track groundwater flow along two pathways. This is very confusing. Please revise. Sentence 5 beginning with "The in-plume well", remove ( ) around the well name which make it seem that is the only in-plume well. Sentence 6 beginning "Monitoring well 67WW01" – it is not likely that 67WW01 is downgradient of 67WW08. More likely cross gradient. Sentence 9 beginning with "However, this well" should mention that well is screened very shallow compared to non-dry wells.	C	Text has been revised.

1 INTRODUCTION

The United States (U.S.) Army Corps of Engineers (USACE), Tulsa District, contracted AECOM Technical Services, Inc. (AECOM), to perform remedial activities at multiple sites at the former Longhorn Army Ammunition Plant (LHAAP), Karnack, Texas, under the Huntsville District's Worldwide Environmental Restoration Services Contract Number (No.) W912DY-09-D-0059, Task Order No. DS01. As part of this contract, AECOM is performing groundwater and surface water monitoring as part of Remedial Action Operations (RA(O)s) for the Monitored Natural Attenuation (MNA) groundwater remedy at site LHAAP-67. A Final Record of Decision (ROD) was executed for LHAAP-67 in June 2010 (USACE, 2010). Groundwater monitoring at LHAAP-67 is ongoing as described in the Draft Final Remedial Action Completion Report (RACR) (AECOM, 2015). This RA(O)s report summarizes the results of sampling activities completed between May 2013 and May 2014.

LHAAP is located in east-central Texas in the northeastern corner of Harrison County between State Highway 43 in Karnack, Texas, and the western shore of Caddo Lake (see **Figure 1-1**). The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the east. Caddo Lake is a large freshwater lake that bounds LHAAP to the north and east. The eastern fence of the LHAAP installation is 3.5 miles from the Texas-Louisiana state border.

1.1 Remedial Action Objectives

The Remedial Action Objectives (RAOs) at the LHAAP-67 site must protect human health and meet applicable or relevant and appropriate requirements. There are no ecological risks at the LHAAP-67 site (USACE, 2010).

The RAOs for the LHAAP-67 site, consistent with the reasonably anticipated future use as a national wildlife refuge, are:

- Protection of human health by preventing human exposure to the contaminated groundwater;
- Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water; and,
- Return of groundwater to its potential beneficial use as drinking water, wherever practicable.

1.2 Performance Objectives

The remedy selected for LHAAP-67 is Land Use Control (LUC) and MNA. The performance objectives at LHAAP-67 consist of two components: physical inspections and groundwater/surface water monitoring. As a component of the LUC implementation, the civil survey of the LUC boundary was conducted in November 2014 and recorded in the Harrison County Courthouse in December 2014. Physical inspections are conducted annually to confirm compliance with the LUC objectives, which consist of preventing human exposure to groundwater contamination presenting an unacceptable risk to a future maintenance worker and ensuring that there is no withdrawal or use of groundwater from the site for anything other than environmental monitoring and testing until the cleanup levels are attained. Groundwater

monitoring has been in-progress at the site since May 2013, and LHAAP-67 will also have Five-Year Reviews completed as part of the site wide Longhorn Five-Year Review.

Groundwater monitoring is being performed to demonstrate that natural attenuation is effective, detect changes in environmental conditions that may reduce the efficacy of natural attenuation processes, identify potentially toxic and/or mobile transformation products, verify that the plume is not expanding, verify no unacceptable impact to downgradient receptors, detect new releases of contaminants to the environment that could impact effectiveness of the natural attenuation remedy, and verify attainment of the remediation objectives.

Work completed as part of the 2013/2014 RA(O) consisted of four quarterly groundwater sampling events at fifteen wells. This report summarizes the LUC compliance inspection, results of groundwater sampling, and a preliminary discussion of MNA evaluation.

1.3 Site Description

LHAAP-67 is in the central portion of LHAAP, on the southeast corner of 48th Street and Ignatus Avenue (see **Figure 1-2**), and covers an area of approximately 1.9 acres. The site topography is relatively flat. The nearest significant surface water body is Central Creek located approximately 870 feet southeast of LHAAP-67. Central Creek eventually flows into Caddo Lake.

When operational, LHAAP-67 consisted of seven above ground storage tanks (ASTs) used for storing No. 2 fuel oil, kerosene, and solvents. The size of the tanks is unknown. The tanks were surrounded by earthen dikes designed to contain potential spills. The ASTs have been removed and the only structure remaining at the site is a railroad bed.

The LUC area associated with the groundwater use restriction at LHAAP-67 extends beyond the historical site boundaries along the western, eastern and southern sections of the site, and encompasses a total of 2.6 acres. LHAAP-67 has no known areas of archaeological or historical importance.

1.4 Conceptual Site Model

A detailed Conceptual Site Model of LHAAP-67 was previously presented in the ROD (USACE, 2010). Based upon additional data collected as part of final remedy implementation as presented in the LHAAP-67 Draft Final RACR (AECOM, 2015), the lithologic units at the site have been reclassified.

Historically, two water-bearing zones (shallow and intermediate) had been designated at LHAAP-67; however, the lithology encountered during 2013 investigation did not identify a continuous clay layer (aquitard) or significant lithological differences between previously identified shallow and intermediate zones. Co-located monitoring wells 67WW06 (total depth 49.83 feet below ground surface) and 67WW07 (total depth 27.86 feet below ground surface), historically identified as intermediate and shallow zone wells, respectively, had almost similar static water levels during the four sampling events performed during 2013/2014 with a maximum difference of 1.04 ft noted during the January 2014 event. Therefore, the previously designated shallow and intermediate zones are now defined as one shallow-water bearing zone to a depth of approximately 50 feet below ground surface and historically identified intermediate zone monitoring well 67WW06 is now classified to be present in the shallow zone.

A deeper "intermediate" water-bearing zone was; however, identified at a depth of approximately 68 feet below ground surface in boring 67DPT14 (drilled in June 2014) with a clear aquitard separating this unit from the shallow zone.

Based on this information, shallow and intermediate water-bearing zones are present in the LHAAP-67 investigation area, but the configuration has been modified from that presented in the remedial design as discussed above.

The contaminants of concern (COCs) identified in LHAAP-67 shallow zone groundwater are trichloroethene (TCE), 1,1-dichloroethene (1,1-DCE), 1,2-dichloroethane (1,2-DCA), 1,1,1-trichloroethane (1,1,1-TCA), and 1,1,2-trichloroethane (1,1,2-TCA). The presence of these COCs in the shallow groundwater zone represents the primary driver for remedial action as they are at concentrations above the human health standard for future maintenance worker under an industrial exposure scenario. There are no ecological risks at the LHAAP-67 site.

The nature and extent of groundwater contamination at LHAAP-67 was evaluated during field investigations conducted between 1998 and 2007. It is believed that historic releases from the ASTs at the site contaminated the soil, with contaminants then leaching from the soil into groundwater. A relatively small area of contamination is observed in the shallow groundwater which poses an unacceptable carcinogenic risk and non-carcinogenic hazard to a hypothetical future maintenance worker under an industrial exposure scenario. There is no groundwater contamination in the deeper "intermediate" groundwater zone. The only potentially complete exposure pathway is via use of shallow-zone groundwater as drinking water. However, shallow groundwater is not used as drinking water at the refuge and the pathway is eliminated from any hypothetical receptor because land use controls are in place that prohibits the use of groundwater other than for environmental monitoring and testing. The nearest significant surface water body to LHAAP-67 site is Central Creek, located upgradient and approximately 870 feet from the site. There is no other surface water body in close proximity to the LHAAP-67 site. Therefore, there is no demonstrated complete pathway from groundwater to surface water.

Based on groundwater level data collected in 2013/2014, the dominant shallow zone groundwater gradient appears to be to the north/northeast. The gradient is based on data collected from up to 15 monitoring wells. Historical gradient was assumed to be to the southeast which was based on data collected primarily from three (3) monitoring wells because some of the wells such as 67WW03 and 67WW04 were dry most of the time. This reinterpretation of the gradient was a result of installation of additional monitoring wells which provided a better definition of the groundwater gradient. The change in groundwater flow direction changed Central Creek from being a downgradient potential receptor to being an upgradient potential receptor from the site. Therefore, potential discharge to surface water in Central Creek became an incomplete exposure pathway and surface water sampling as stated in the RAWP was no longer necessary.

A temporary well installed in soil boring 67DPT14 was completed in the deeper "intermediate" water-bearing zone to a depth of 78 feet below ground surface. Groundwater analyzed from 67DPT14 revealed that no COCs were identified. Therefore, the contaminants are confined to the shallow zone groundwater.

2 SITE ACTIVITIES AT LHAAP-67

2.1 Annual LUC Compliance Inspection, Monitoring, and Repairs

AECOM performed the annual LUC compliance inspection for LHAAP-67 site on July 10, 2014. The Annual LUC Compliance Certification Documentation Form is included in **Appendix A**. No non-compliance issues or concerns were noted during the annual inspection.

No damage to bollards, pads, or protective casings was observed and minimal encroachment of weeds or brush on the well pads was observed. Monitoring well identification tag replacement, as well as painting/re-labeling as needed, for wells outside the current monitoring network was completed in Fall 2013.

2.2 Groundwater Monitoring

For the 1st year RA(O), four quarterly groundwater sampling events of 15 monitoring wells were completed in May 2013 (only 13 wells were included in May 2013 because monitoring wells 67WW09A and 67WW14 were installed after May 2013; no impact on data evaluation to date due to the late installation of these two wells was observed because these wells serve as boundary (perimeter) wells and COCs in these wells have remained below cleanup levels as discussed below), September 2013, January 2014, and May 2014. The monitoring wells are depicted in **Figure 2-1** and listed in **Table 2-1**. Each of the 15 wells was sampled with no technical issues encountered.

Before collecting groundwater samples, the wells were gauged using a water level probe and the depth to water recorded to the neared 0.01 foot from the top of casing. Water samples were collected using the low-flow sampling technique as described in the Groundwater Sampling Procedures found in the Installation-Wide Work Plan (AECOM, 2014). The objective of using this method was to collect representative samples of the groundwater in the formation adjacent to the well screen, eliminating the mixing of stagnant water above and below the well screen. After water quality parameters stabilized and were within acceptable ranges, samples were collected at the same low flow rate.

2.2.1 Approved Modifications to the Groundwater Monitoring Program

During this first year of RAO, minor modifications were made to the groundwater monitoring program, with U.S. Environmental Protection Agency (USEPA) and TCEQ concurrence.

- 67WW04. While 67WW04 was utilized historically to bound the plume to the south, new wells 67WW09A and 67WW10 now serve that purpose, providing better refinement of the plume boundary. 67WW04 will continue to be gauged for water level during each sampling event, but will no longer be sampled for VOCs or evaluated for field parameters.
- 67WW06. Based on changes in designation of groundwater bearing zones at LHAAP-67 described in the Remedial Action Completion Report (AECOM, 2015), co-located shallow zone monitoring wells 67WW06 and 67WW07 are now considered duplicative. Of the well pair, 67WW07 with a shallower screened interval was retained for monitoring, while eliminating 67WW06 from further monitoring. Well 67WW06 will continue to be gauged for water level during each sampling event.

- Monitoring wells 67WW01 and 67WW08 were selected in the RAWP for collection of geochemical parameters. However, 67WW01 has been dry on two occasions and had insufficient water to collect MNA geochemical parameters on a third event. Therefore, MNA geochemical parameters were collected from 67WW11 in October 2013 instead. However, based on assessment of COC concentrations and location of monitoring wells with respect to the plume, it was determined that future sampling for MNA geochemical parameters will occur from monitoring well 67WW13 in addition to 67WW08.

2.2.2 Groundwater Elevations and Flow Direction

During the May 2013 event, monitoring well 67WW04 was noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Groundwater data was not collected from well 67WW05 and wells 67WW14, and 67WW09A did not exist during this event. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northerly (**Figure 2-2**).

During the September 2013 event, monitoring wells 67WW01, 67WW03, and 67WW04, were dry. Additionally, the groundwater elevation measured at 67WW12, on the north side of the site, is higher than typical and appears to be an outlier; therefore, it was not used in contouring. Gauging data were used to construct a potentiometric surface map; however, the presence of dry wells and the elevation outlier, specifically on the north side of the site at 67WW03 and 67WW12, diminished the ability to construct a complete potentiometric contour map. Based on the available gauging data during this event, the interpreted flow directions may vary from east, to northeast, and north (**Figure 2-3).**

During the January 2014 event, monitoring wells 67WW01, 67WW03, and 67WW04, were noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northeasterly (**Figure 2-4**).

During the May 2014 event, monitoring wells 67WW03 and 67WW04 were noted to be dry. The presence of dry wells did not diminish the ability to construct a complete potentiometric contour map. Based on the gauging data during this event, the groundwater flow direction is interpreted to be northerly (**Figure 2-5**).

Groundwater elevations generally decreased by up to one foot across the site between May 2013 and September 2013 and subsequently (between September 2013 and May 2014) rose by greater than one foot across the site. However, well 67WW01, located within the VOC plume and designated as one of the wells for collection of MNA parameters, was dry in two of the four quarterly monitoring events. This is likely because this well is relatively shallower compared to other wells with the bottom of the screen interval at 24.68 feet below top of casing (ft TOC) and the static water level is below the screen bottom. As such, limited data is available from this well for use in the MNA evaluation or analysis of plume stability.

Based on data collected during the first year of RA(O), groundwater flow direction is generally noted to be in the north/northeasterly direction. The interpretation of groundwater flow direction has altered from what was presented previously in the Remedial Design document (Shaw, 2011) (see **Figure 2-6**). This is likely due to the installation of additional monitoring wells which provided a better definition of the groundwater gradient. The drier weather conditions the area

has experienced in the past four years could have also influenced the predominant gradient of groundwater at the site.

A photo log representing the condition of a few select wells is included in **Appendix B**.

2.2.3 Groundwater Analytical Results

Analytical results for the quarterly samples are presented on **Table 2-2**. **Figures 2-7 through 2-10** depict the VOC data in wells sampled in May 2013, September 2013, January 2014, and May 2014, respectively.

Over the course of the 1st year of RA(O), wells 67WW01, 67WW08, 67WW09, 67WW11, and 67WW13, contained COCs above the respective cleanup levels. The highest concentrations of COCs were detected in wells 67WW08 and 67WW11. The trends of COC concentrations in monitoring wells with COC concentrations greater than the maximum contaminant level (MCL) / Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) (USEPA, 2014) are depicted in graphs presented on **Figure 2-11**.

Historically, since December 1998 and prior to May 2013, concentrations of COCs in 67WW01 were greater than their MCLs as shown on **Table 2-3**. Other monitoring wells such as 67WW02 and 67WW03 had COCs greater than their MCLs (December 1998) but subsequent sampling events revealed COC concentrations below the laboratory detection limits.

An expanded discussion on the VOCs and their distribution including trends is included **Section 3.1**.

Groundwater monitoring well sampling forms were completed for each monitoring well sampled and are included in **Appendix C**. Laboratory analytical results are included in **Appendix D**.

2.3 Surface Water Sampling

As discussed in the LHAAP-67 site RACR, semi-annual sampling of surface water from one location in Central Creek was planned (AECOM, 2015). The Central Creek surface water sampling location was dry during the baseline groundwater monitoring event and no surface water sample was collected.

Subsequently, with the addition of multiple new shallow zone monitoring wells, the potentiometric surface of groundwater was more clearly defined. Consequently, the shallow zone groundwater flow direction (north/northeast) interpreted from quarterly well gauging data indicates that Central Creek located south of the LHAAP-67 site is up gradient and, therefore, is not an appropriate surface water body to monitor for potential impacts from LHAAP-67. As shown in **Figure 1-2**, Goose Prairie Creek is located downstream to the north but at a distance of more than 1,500 feet from the LHAAP-67 site. The plume is delineated within the LUC boundary and there is no other surface water body downgradient or in close proximity of the LHAAP-67 site to collect an appropriate surface water sample. Therefore, no further surface water monitoring is planned for the LHAAP-67 site.

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

µg/L - microgram per liter

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

µg/L - microgram per liter

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

µg/L - microgram per liter

Blue Highlighting Indicates concentrations above the MCL/PCL

"FD" in Sample ID indicates a field duplicate sample.

CEQ/mL - cells equivalent per milliliter

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

mg/L - milligram per liter

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

µg/L - microgram per liter

Table 2-3: Historical Groundwater COC Concentrations - LHAAP-67

3 NATURAL ATTENUTION EVALUTION

The following sections present the results of the natural attenuation evaluation in accordance with the three lines of evidence discussed in the RACR (AECOM, 2015) for site COCs.

3.1 First Line of Evidence: Change in COC Concentrations over Time and with Distance

Natural attenuation is the combination of multiple mechanisms, including biodegradation, volatilization, dilution, advection, and absorption that reduce contaminant concentrations. The decrease of COC concentrations over time and distance is evidence of natural attenuation. The change in groundwater COC concentrations over time and with distance was evaluated at LHAAP-67. VOC concentrations for the 2013/14 period for the five wells with COC concentrations above the MCLs are identified on **Figure 2-11**. Historical COC concentrations are provided in **Table 2-3**.

Of all the wells included in the monitoring program, the only wells that detected COCs above respective cleanup levels are 67WW01, 67WW08, 67WW09, 67WW11, and 67WW13. The other wells in the monitoring program did not contain COCs above the cleanup levels in the four sampling events. Based on the direction of groundwater flow, wells 67WW09A and 67WW10 can be considered background wells and monitoring wells 67WW02 and 67WW12 are considered downgradient wells. The following discussion is focused on VOC trends noted in the five wells with COCs above the MCL: 67WW01, 67WW08, 67WW09, 67WW11, and 67WW13.

Well 67WW01

A total of six data sets are available for this well, including the first set collected in 1998. For the period of 2013-14, data is available only from two sampling events, as the well was dry during the September 2013 and January 2014 events. 1,1,1-TCA and 1,1,2-TCA were detected above the MCL in 1998 (Table 2-3); however, these constituents have remained below the MCL since that event. Concentrations of 1,1-DCE (degradation product of 1,1,1-TCA) and 1,2-DCA (degradation product of 1,1,2-TCA) have generally remained stable over the last year with a slight increase observed in May 2014, but considerably lower than the 1998 levels. VC (a degradation product of TCE) has also been detected slightly above the MCL during the last year. TCE levels have remained below the cleanup level in this well. The well was dry in two of the four events during 2013/14, likely due to static groundwater level remaining below the bottom of the well screen. Therefore, limited data is available from this well for use in the MNA evaluation or analysis of plume stability. When insufficient sample volume was available to collect MNA parameters from 67WW01, MNA parameters were collected from 67WW11.

Well 67WW03

A total of four historical data points between 1998 and 2006 are available for this well. No data were collected in 2013/2014 because the well was dry. In the December 1998 sample, 1,1,1-TCA, 1,1,2-TCA, and 1,1-DCE were reported at concentrations of 1,800 μg/L, 24 μg/L, and 36 μg/L, respectively. Subsequent three data points collected between 2004 and 2006 denoted non-detect levels for these compounds, indicating that the initially reported concentrations are suspect and/or not representative of the shallow zone groundwater. Because this well has been

chronically dry, it was replaced by adjacent well 67WW12, which is screened across an interval that is approximately 10 feet deeper than well 67WW03. Concentrations of COCs in 67WW12 which was sampled in 2013/2014 were non-detect, corroborating the 2004 to 2006 results from 67WW03.

Well 67WW08

This well was installed in 2013. TCE has remained below the cleanup level in this well. Over the last year, 1,1,2-TCA levels remained close to its MCL of 5 ug/L. 1,1-DCE increased over the monitoring period with each subsequent event from 940 µg/L to 1120 µg/L to 1340 µg/L, and 1590 µg/L. 1,2-DCA levels have fluctuated between 76.5 µg/L and 101 µg/L. These results indicate that natural attenuation is not observed in this monitoring well.

Well 67WW09

This well was installed in 2013. Only 1,1-DCE has been detected in this well above the MCL with the levels increasing from 16.1 µg/L (June 2013) to 20.8 µg/L (January 2014). This well was not sampled in May 2014, because a monitoring well adjustment plan that was submitted to the regulators in April 2014, with a recommendation to remove this well (and 67WW11) from sampling. It was assumed that the adjustment plan would be approved. However, it was not until the November 2014 monthly managers' meeting that all parties agreed to hold off on any changes to the monitoring network until a year of data from the existing well network was obtained. For this reason, 67WW09 was not sampled in May 2014. Another well, 67WW09A was installed upgradient to bound the plume in the south and upgradient direction and defines the south LUC boundary. VOC data in well 67WW09A has remained below the cleanup levels.

Well 67WW11

This well was installed in 2013. Similar to well 67WW09, only 1,1-DCE has been detected in this well above the MCL with the levels decreasing from 47.1 µg/L (June 2013) to 38.8 µg/L (January 2014). This well was not sampled in May 2014, because a monitoring well adjustment plan that was submitted to the regulators in April 2014, with a recommendation to remove this well 67WW11 (and 67WW09)) from sampling. It was assumed that the adjustment plan would be approved. However, it was not until the November 2014 monthly managers' meeting that all parties agreed to hold off on any changes to the monitoring network until a year of data from the existing well network was obtained. For this reason, 67WW11 was not sampled in May 2014. Another well, 67WW09A, was installed upgradient to bound the plume in the south and upgradient direction and defines the south LUC boundary. VOC data in well 67WW09A has remained below the cleanup levels.

Well 67WW13

This well was installed in 2013. 1,1-DCE, 1,2-DCA, and VC have been detected in this well during the monitoring period. For the first three events of the monitoring period 1,1-DCE levels remained close to 550 µg/L and then decreased to 240 µg/L during the May 2014 event. Similar trends were observed for 1,2-DCA and VC with VC decreasing below the MCL in May 2014 at a concentration of 0.644 ug/L.

3.1.1 Plume Stability

COC plume maps completed for each sampling event are presented in **Figures 2-7** through **2-10**. The COC data over the monitoring period indicate that the plume is showing overall stable conditions. Based on the variable groundwater flow directions (but generally northerly), the following wells can be considered to be along the northeasterly groundwater flow path: 67WW09A, 67WW11, 67WW08, and 67WW12/67WW03. Wells 67WW10, 67WW08, 67WW01, and 67WW02 are considered to be along the northwesterly flow path. The COCs in up gradient wells 67WW09A and 67WW10 have remained below the cleanup levels throughout the reporting period. The in-plume well 67WW08 exhibits the highest levels of COCs which have generally remained stable, with an observed increase in 1,1-DCE concentration. Monitoring well 67WW01, which depending on groundwater flow direction could be considered a cross-gradient well for 67WW08, exhibits lower concentrations of 1,1,2-trichloroethane, 1,1-dichloroethene, and 1,2-dichloroethane than in 67WW08The downgradient well 67WW03 located in close proximity to 67WW12) is screened shallower than most of the productive site and has been dry during three of the four events and had insufficient water for a sample to be collected in the fourth event (May 2013). However, this well had no detects of COCs between 2004 and 2006, the last time this well was sampled. The COCs in downgradient wells 67WW02 and 67WW12 have remained below detection during the RA(O) period of performance. Therefore, based on the inferred flow path (using the groundwater flow direction), the COC plume is not expanding with distance from the source area as evidenced by non-detection of COCs in downgradient wells 67WW02 and 67WW12. Concentrations of COCs in individual wells over time have either remained stable or slightly decreased with the exception of 1,1-DCE in wells 67WW01, 67WW08, and 67WW09.

Concentrations of COCs in perimeter wells surrounding the most impacted wells 67WW01, 67WW08, and 67WW13 in all directions have identified no increase or new detections of COCs (boundary area wells 67WW02, 67WW12, 67WW07, 67WW10, 67WW09A, 67WW14, and 67WW05), indicating no plume migration with complete definition of plume extent in all directions. Boundary well 67WW02, a downgradient well, had no detections of any COC since 2004; boundary well 67WW12, a downgradient well which was installed in 2013, had no detections of any COCs during the reporting period; boundary well 67WW07, generally classified as a cross-gradient well, had low detections of 1,2-DCA consistently below the MCL; boundary well 67WW10, an upgradient well which was installed in 2013, had no detections of any COCs during the reporting period; boundary well 67WW09A, an upgradient well which was installed in 2013, had no detections of any COCs during the reporting period; boundary well 67WW14, a cross gradient to an upgradient well installed in 2013, had low detections of 1,1-DCE and 1,2-DCA consistently below the MCLs; boundary well 67WW05, generally considered a cross-gradient well, had no detections of any COCs since it was first sampled in 2000. **Table 2-3** present the analytical results in these wells.

Although only a few data points exist, the relationship between groundwater level elevations and COC concentrations was reviewed. A review of the data in individual wells over the course of the monitoring period does not indicate any definite correlation between groundwater elevations and COC concentrations as depicted in **Figure 2-11**. For example, 1,1,2-trichloroethane in 67WW08 had a -18% correlation coefficient with groundwater elevation, 1,1-dichloroethene in 67WW08 had a 65.1% correlation coefficient with groundwater elevation, and 1,2-dichloroethane in 67WW08 had a 97.4% correlation coefficient with groundwater elevation.

These disparate correlation coefficients between COCs and groundwater elevation change in the same well indicate the weak seasonal effects on well COC concentrations. Another example for change in 1,1-dichloroethene concentration versus groundwater elevation change across several wells reveal the following results: 65.1% correlation coefficient in 67WW08, 4.6% correlation coefficient in 67WW09, 26% correlation coefficient in 67WW11, and -75.3% correlation coefficient in 67WW13. These widely dispersed correlation coefficients for the same COC across several monitoring wells indicate the lack of a defined correlation between COC concentration and groundwater levels or lack of seasonality effects. The supporting data for the correlation coefficients are provided in Appendix E.

3.2 Second Line of Evidence: Geochemical Indicators

Table 2-2 presents geochemical indicators that are useful MNA evaluation parameters. Some geochemical indicators are collected in the field, and are recorded for all sampling events for all wells. The field parameters for LHAAP-67 wells include: dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, conductivity, turbidity, ferrous iron, and temperature.

DO is the most thermodynamically favored electron acceptor used by microbes for biodegradation of organic carbon, whether natural or anthropogenic (USEPA, 1998). Anaerobic bacteria generally cannot function at DO concentrations greater than about 0.5 milligrams per liter (mg/L) and hence, reductive dechlorination will not occur. During the course of the monitoring period, the DO levels in well 67WW01 have remained above 8 mg/L, and in the other two most contaminated wells, 67WW08 and 67WW13, have ranged between less than 0.5 mg/L and 2.0 mg/L. The low DO level in 67WW08 with a maximum reported concentration of 0.74 mg/L in October 2013, bodes well for reductive dechlorination.

The ORP levels indicate how oxidative or reductive the groundwater is in the aquifer matrix and provide real-time data if conditions are conducive for anaerobic biodegradation. ORP values less than 50 milli-volts (mV) are indicative that the aquifer is reaching anaerobic conditions and are favorable for the biological reductive dechlorination of chlorinated ethenes and ethanes. The ORP measurements at LHAAP-67 during the monitoring period have generally been negative in the highest contaminated well (67WW08) ranging between -165 mV (October 2013) to 74 mV (June 2013). In other wells within the plume (67WW01, 67WW09, 67WW11, and 67WW13), the ORP has generally been near or greater than 50 mV indicating a higher level of oxidative conditions than observed in 67WW01. Given the presence of biodegradation products (1,2-DCA) in well 67WW08, the aquifer conditions (low DO and negative ORP) appear to be conducive for reductive dechlorination in the vicinity of 67WW08. However, over the entire extent of the plume, the conditions are generally aerobic and do not support reductive dechlorination.

After DO has been depleted in the microbiological treatment zone, nitrate may be used as an electron acceptor for anaerobic biodegradation of organic carbon via denitrification. In order for reductive dechlorination to occur, nitrate concentrations in the contaminated portion of the aquifer must be less than 1.0 mg/L (USEPA, 1998). **Table 2-2** indicates that nitrate and nitrite concentrations were generally below the laboratory reporting limits at LHAAP-67 groundwater. Therefore, nitrate reduction is not a likely a mode of microbial respiration at the site, and the lack of nitrate is favorable for achieving the highly reducing conditions ideal for anaerobic reductive dechlorination.

In some cases, iron (III) (ferric iron) is used as an electron acceptor during anaerobic biodegradation of organic carbon. During this process, iron (III) is reduced to iron (II) (ferrous iron), which may be soluble in water. Ferrous iron concentrations can thus be used as an indicator of anaerobic degradation of fuel compounds, and VC. Ferrous iron concentrations were measured in wells 67WW01 and 67WW08 and ranged from 0.0795 mg/L to 0.344 mg/L in 67WW08 and was reported at 5.69 mg/L (a single measurement conducted in May 2014) in 67WW01. Ferrous iron concentrations indicate limited reductive conditions.

After DO and nitrate have been depleted in the microbiological treatment zone, sulfate may be used as an electron acceptor for anaerobic biodegradation. This process is termed "sulfate reduction" and results in the production of sulfide. Concentrations of sulfate greater than 20 mg/L may cause competitive exclusion of dechlorination. However, in many plumes with high concentrations of sulfate, reductive dechlorination still occurs (USEPA, 1998).

Table 2-2 indicates that the sulfate concentrations ranged from 167 mg/L in 67WW01 to 365 mg/L in 67WW08 during the May 2014 sampling event. Relatively high concentrations of sulfate and corresponding sulfide concentrations below laboratory reporting limit of 1 mg/L indicates that the conditions in the aquifer are not conducive for sulfate reduction.

Methanogenesis occurs in highly reducing conditions and generally occurs after oxygen, nitrate, and sulfate have been depleted. Methane levels above 500 µg/L is considered to indicate methanogenic conditions (USEPA, 1998). Methane was measured in wells 67WW01 and 67WW08 and was generally found to be below 50 µg/L.

Regardless of the electron acceptor being used, organic carbon is a required source of reduced carbon and energy to sustain microbial activity. Total organic carbon (TOC) is utilized as a carbon and energy source to support the reductive dechlorination of the chlorinated COCs. TOC concentrations greater than 20 mg/L are considered adequate to support microbial activity (USEPA, 1998). TOC concentration was measured in wells 67WW01 and 67WW08 and was found to be below 20 mg/L.

The pH of ground water has an effect on the presence and activity of microbial populations in ground water. This is especially true for bacteria responsible for reductive dechlorination. Microbes capable of degrading chlorinated aliphatic hydrocarbons and petroleum hydrocarbon compounds generally prefer pH values varying from 6 to 8 standard units (USEPA, 1998). The shallow zone groundwater pH within the plume has been between 5.3 and 7.1 standard units with pH values in wells 67WW01 and 67WW08 below 6. The conditions in these wells will be prohibitive for dechlorinating bacteria.

Ethane and ethene, the two end products of the reductive dechlorination pathways for chlorinated ethanes and ethenes, were also below the laboratory reporting limits during the monitoring period in 67WW01, 67WW08, and 67WW11, indicating that complete dechlorination is not taking place.

Dechlorinating bacteria, dehalococcoides ethenogenes and associated functional genes were analyzed in wells 67WW01 and 67WW08, located within the VOC plume. Generally, the microbial population count and the functional gene counts were below the laboratory reporting limits, indicating limited population count of the bacteria and absence of gene expression necessary for anaerobic biological degradation of the COCs.

The qualitative assessment of geochemical indicators and the absence of dechlorinating bacteria in the shallow groundwater zone at LHAAP-67 indicate current geochemical conditions are not optimal for MNA. Nonetheless, certain parameters observed in a few locations may indicate that conditions could favor natural attenuation, such as the low DO and negative ORP observed in 67WW08. The presence of methane and dissolved iron also provides evidence that reducing anaerobic conditions can be present even within high DO areas such as at 67WW01. Although, degradation products (1,2-DCA, 1,1-DCE, and VC) have been detected in the plume monitoring wells, adequate conditions within the impacted area currently do not exist to sustain complete reductive dechlorination.

3.3 Third Line of Evidence: Predictive Modeling and Microbial Analysis

If the first two lines of evidence for MNA are deemed inadequate or inconclusive, and/or if the need for a contingency remedy is evaluated, data from field or microcosm studies will be necessary to establish the third line of evidence for MNA. Evaluation of the third line of evidence will be deferred until the initial two-year groundwater monitoring program has been completed and a more thorough technical evaluation of MNA is completed for the site.

4 SUMMARY AND CONCLUSIONS

VOC data and geochemical indicators were collected over the course of the monitoring period at LHAAP-67 to evaluate effectiveness of MNA as a site remedy. A tiered approach assessing the first two of three lines of evidence was used to evaluate the occurrence of natural attenuation in site groundwater. The first line of evidence evaluated reductions in COC concentrations over time and with distance, the second line of evidence evaluated geochemical indicators, while the third line of evidence will be deferred until the initial two-year groundwater monitoring program has been completed. The results of the tiered evaluation and the conclusions are summarized below.

An assessment of the first line of evidence indicate that the plume is showing overall stable conditions but not decreasing. The in-plume well 67WW08 exhibits the highest levels of COCs which have generally remained stable, with the exception of 1,1,-DCE, which exhibited an increasing trend throughout the reporting period. Monitoring well 67WW01, which depending on groundwater flow direction could be considered a cross-gradient well for 67WW08, exhibits lower concentrations of 1,1,2-trichloroethane, 1,1-dichloroethene, and 1,2-dichloroethane than in 67WW08. The downgradient well 67WW03 is located in close proximity to 67WW12 and is screened shallower than most of the productive site wells. 67WW03 has been dry in three of the four events and had insufficient water for a sample to be collected during the fourth event (May 2013). The COCs in downgradient wells 67WW02 and 67WW12 have remained below detection. Therefore, based on the inferred flow path (using the groundwater flow direction), COC levels are not increasing with distance from the source area as evidenced by non-detection of COCs in downgradient wells 67WW02 and 67WW12. Concentrations of COCs in individual wells over time have either remained stable or slightly decreased with the exception of 1,1-DCE in wells 67WW01, 67WW08, and 67WW09. Concentrations of COCs in perimeter wells away from the most impacted wells 67WW01 and 67WW08 have identified no increase or new detections of COCs (boundary area wells 67WW02, 67WW12, 67WW10, 67WW09A, 67WW14, and 67WW05), indicating no plume migration. The data sets for LHAAP-67 (including historical results) are limited to six events and the wells will continue to be monitored for decreasing concentration trends.

The qualitative assessment of geochemical indicators and the absence of dechlorinating bacteria in the shallow groundwater zone at LHAAP-67 indicate current geochemical conditions are not optimal for MNA. Although, degradation products (1,2-DCA, 1,1-DCE, and VC) have been detected in the plume monitoring wells, adequate conditions within the impacted area currently do not exist to sustain complete reductive dechlorination.

Based on the collected data thus far, MNA associated with biodegradation appears not to be occurring in the shallow groundwater at LHAAP-67. The concentration decrease observed in some COCs in some wells are likely associated with other MNA occurrences such as dilution and volatilization. The VOC plume is currently considered stable and does not show signs of downgradient migration (i.e., expansion in size).

Groundwater monitoring continues to be performed at LHAAP-67 in compliance with the Remedial Action Work Plan (AECOM, 2013). However, collection of additional MNA parameter data from 67WW13 will be conducted in the future to provide enhanced spatial

distribution of MNA data for 2nd year RA(O) evaluation. No change in land or groundwater use has occurred at the site, and the use of the site is still consistent with that mandated by the ROD.

APPENDIX A: ANNUAL LUC COMPLIANCE CERTIFICATION DOCUMENTATION

AECOM

Annual Land Use Control Compliance Certification Documentation

In accordance with the Remedial Design dated September 2011 for LHAAP-67 a certification of site was conducted by Aecom Technical Services on July 10, 2014

A summary of land use control mechanisms is as follows:

- Groundwater restriction – restriction of the use of groundwater to environmental monitoring and testing until cleanup goals are met

A summary of compliance with land use and restriction covenants is as follows:

- No use of groundwater, installation of new groundwater wells, or tampering with existing wells at LHAAP-67

I, the undersigned, do document that the certification was performed as indicated above, and that the above information is true and correct to the best of my knowledge, information, and belief.

Date: July 10, 2014

Linda Raabe
AECOM Technical Services, Inc.
112 East Pecan
San Antonio, TX 78205

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Erin Long – Project Chemist
(740) 373-4071
Erin.Long@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on April 12 2013

David Vandenberg – Managing Director

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0017551	H	3.0		1ZAX65772210000040

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040315
Project Name:		**Method:**	8260
Prep Batch Number(s):	426251, 426300	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-12 00:00:00		

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040315
Project Name:		**Method:**	8260
Prep Batch Number(s):	426251, 426300	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-12 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040315
Project Name:		**Method:**	8260
Prep Batch Number(s):	426251, 426300	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-12 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?		X			2
Was the ICAL curve verified for each analyte?		X			1
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040315
Project Name:		**Method:**	8260
Prep Batch Number(s):	426251, 426300	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-12 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

LRC Date:	2013-04-12 00:00:00		

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1) Acetone was below the LCL and dichlorodifluoromethane exceeded the UCL.
2) 2-Butanone was below the LCL.

1.2 Certificate of Analysis

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

Microbac Laboratories Inc.
List of Valid Qualifiers
April 12, 2013

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
U	Analyte was not detected. The concentration is below the reported LOD.
UB	Analyte was not detected. The concentration is below the reported LOQ, however the reported result is associated with a c
UJ	Undetected; the analyte was analyzed for, but not detected.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - March 7, 2013

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVL NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Thiodiglycol (TDG-LCMS)
Ethylene Glycol (Non-potable Water)
Aroclor 1262 (Non-potable Water)

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL HPLC02/HPLC-UV

Nitroglycerin
Nitroguanidine
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVL KNITRO-C-WUV-VIS

Nitrocellulose

OVL MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam
Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL MSV0I/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVL RSKOI/GC-FID

Isobutane
n-Butane
Propane
Propylene
Propyne

OVL HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

SOLID AND HAZARDOUS CHEMICALS

OVL HPLCOS-HPLC-UV

Nitroguanidine

OVL KNITRO-C-S/UV-VIS

Nitrocellulose

OVL MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVL MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

San Antonio, TX 78205

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Erin Long – Project Chemist
(740) 373-4071
Erin.Long@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on April 22 2013

David Vandenberg – Managing Director

State of Origin: TX
Accrediting Authority: Texas Commission on Environmental Quality ID:T104704252-07-TX

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0017577	I	3.0		1ZAX65772210000013

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040768
Project Name:		**Method:**	8260
Prep Batch Number(s):	427303	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-22 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040768
Project Name:		**Method:**	8260
Prep Batch Number(s):	427303	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-22 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?		X			1
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040768
Project Name:		**Method:**	8260
Prep Batch Number(s):	427303	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-04-22 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13040768
Project Name:		**Method:**	8260

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1) Dichlorodifluoromethane exceeded the upper control limit in the Alternate Source analyzed 03/29/2013 on HPMS8.

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

Microbac Laboratories Inc.
List of Valid Qualifiers
April 22, 2013

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
U	Analyte was not detected. The concentration is below the reported LOD.
UB	Analyte was not detected. The concentration is below the reported LOQ, however the reported result is associated with a c
UJ	Undetected; the analyte was analyzed for, but not detected.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - March 7, 2013

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVL NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Thiodiglycol (TDG-LCMS)
Ethylene Glycol (Non-potable Water)
Aroclor 1262 (Non-potable Water)

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL HPLC02/HPLC-UV

Nitroglycerin
Nitroguanidine
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVL KNITRO-C-WUV-VIS

Nitrocellulose

OVL MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam
Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL MSV0I/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVL RSKOI/GC-FID

Isobutane
n-Butane
Propane
Propylene
Propyne

OVL HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

SOLID AND HAZARDOUS CHEMICALS

OVL HPLCOS-HPLC-UV

Nitroguanidine

OVL KNITRO-C-S/UV-VIS

Nitrocellulose

OVL MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVL MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

Microbac

Laboratory Report Number: L13060134

Linda Raabe
AECOM Technical Services, Inc.
112 East Pecan
San Antonio, TX 78205

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Tony Long – Team Chemist/Data Specialist
(740) 373-4071
Tony.Long@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on June 17 2013

David Vandenberg – Managing Director

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0018923	I	4.0		J2317153736
0015745	I	4.0		J2317153745

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	Yes
12	Were VOA samples free of headspace (less than 6mm)?	Yes

1.0 Summary Data

1.1 Narratives

Microbac Laboratories
Case Narrative

Login Number: L13060134
Department: Volatiles - GC
Analyst: Franci Bolden

Analysis RSK-175

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes/Sample Duplicates: The MS/MSD results were not associated with this sample delivery group (SDG), due to insufficient volume of sample. Microbac Laboratories recommends site specific MS/MSD samples to avoid possible data qualifications.

SAMPLES

Samples: All acceptance criteria were met.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration

is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13060134
Project Name:		**Method:**	8260
Prep Batch Number(s):	433470,433591,433686,433810	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-06-14 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13060134
Project Name:		**Method:**	8260
Prep Batch Number(s):	433470,433591,433686,433810	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-06-14 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?		X			2
Was the ICAL curve verified for each analyte?		X			1
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X

Method detection limit (MDL) studies					
Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this

data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1) Acetone, carbon disulfide, and dichlorodifluoromethane were outside the control limits in the Alternate Source analyzed 05-14-13 on HPMS10.
Vinyl chloride, chloromethane, acetone, dichlorodifluoromethane, and styrene were outside the control limits in the Alternate Source analyzed 05-16-13 on HPMS11. Dichlorodifluoromethane was outside the control limits in the Alternate Source analyzed 04-02-13 on HPMS6.
2) Acetone, dichlorodifluoromethane, and styrene were outside the control limits in the water CCV analyzed 06-10-13 on HPMS11.
Chloromethane, 1,1,2,2-tetrachloroethane, bromomethane, 1,3-dibromo-3-chloropropane, and dichlorodifluoromethane were outside the control limits in the water CCV analyzed 06-10-13 on HPMS6. Chloromethane, dichlorodifluoromethane, and styrene were outside the control limits in the water CCV analyzed 06-12-13 on HPMS10.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?			X		
Were % moisture (or solids) reported for all soil and sediment samples?			X		
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?		X			1
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13060134
Project Name:		**Method:**	RSK175
Prep Batch Number(s):	433492	**Reviewer Name:**	Michael Albertson
LRC Date:	2013-06-14 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?			X		
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X

Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):	X				
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13060134
Project Name:		**Method:**	FERROUS
Prep Batch Number(s):	WG433068	**Reviewer Name:**	Deanna Hesson
LRC Date:	2013-06-15 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?	X				
Were analytical duplicates analyzed at the appropriate frequency?	X				
Were RPDs or relative standard deviations within the laboratory QC limits?	X				
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?			X		
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L13060134
Project Name:		**Method:**	FERROUS
Prep Batch Number(s):	WG433068	**Reviewer Name:**	Deanna Hesson
LRC Date:	2013-06-15 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?			X		
Were ion abundance data within the method-required QC limits?			X		
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?			X		
Raw data (NELAC Section 5.5.10)			X		
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?			X		
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)			X		
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions			X		
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

Laboratory Data Package Cover Page

	R1	Field chain-of-custody documentation;
	R2	Sample identification cross-reference;
	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
	R5	Test reports/summary forms for blank samples;
	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
	R10	Other problems or anomalies.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification					
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):	X				
Were all COCs included in the LCS?	X

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L
