LONGHORN ARMY AMMUNITION PLANT
KARNACK, TEXAS
ADMINISTRATIVE RECORD – CHRONOLOGICAL INDEX

VOLUME 1

2017

A. Title: Meeting Minutes – Longhorn Army Ammunition Plant Restoration Advisory Board (RAB) Meeting Minutes
Author(s): AECOM Technical Services
Recipient: All Stakeholders
Date: October 20, 2016
Bate Stamp: 00634172 – 00634272

B. Title: Report - Draft Final 2nd Annual Remedial Action Operation Report for LHAAP-50, Former Sump Water Tank, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: November 17, 2016
Bate Stamp: 00634273 – 00654336

C. Title: Meeting Minutes – Longhorn Army Ammunition Plant Monthly Managers' Meeting Minutes
Author(s): AECOM Technical Services
Recipient: All Stakeholders
Date: November 17, 2016
Bate Stamp: 00654337 – 00654357

D. Title: Meeting Minutes – Longhorn Army Ammunition Plant Monthly Managers' Meeting Minutes
Author(s): AECOM Technical Services
Recipient: All Stakeholders
Date: December 15, 2016
Bate Stamp: 00654358 – 00654386

E. Title: Report - Draft Final Supplemental to the Updated Post-Screening Investigation Report for LHAAP-18/24, Burning Ground No. 3 and Unlined Evaporation Pond, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: December 28, 2016
Bate Stamp: 00654387 – 00692738

LONGHORN ARMY AMMUNITION PLANT
KARNACK, TEXAS
ADMINISTRATIVE RECORD – CHRONOLOGICAL INDEX

VOLUME 1

2017

F. Title: Report - Draft Final Remedial Design for LHAAP-16 Landfill, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: January 18, 2017
Bate Stamp: 00692739 – 00692925

G. Title: Meeting Minutes – Longhorn Army Ammunition Plant Monthly Managers' Meeting Minutes
Author(s): AECOM Technical Services
Recipient: All Stakeholders
Date: January 19, 2017
Bate Stamp: 00692926 – 00692950

H. Title: Report - Final Revised Feasibility Study for LHAAP-18/24, Burning Ground No. 3 and Unlined Evaporation Pond, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: January 27, 2017
Bate Stamp: 00692951 – 00731961

I. Title: Report - Draft Final 1st Annual Remedial Action Operation Report for LHAAP-67, Above Ground Storage Tank Farm, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: January 31, 2017
Bate Stamp: 00731962 – 00737041

J. Title: Letter - Cessation of Perimeter Well Sampling Requirement of the December 2, 1999 Dispute Resolution, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): U.S. Army Corps of Engineers
Recipient: All Stakeholders
Date: February 6, 2017
Bate Stamp: 00737042 – 00737045

LONGHORN ARMY AMMUNITION PLANT
KARNACK, TEXAS
ADMINISTRATIVE RECORD – CHRONOLOGICAL INDEX

VOLUME 1

2017

K. Title: Memorandum for Record - Groundwater Sampling Methodology and Perchlorate Analytical Results for September 2016, LHAAP-003-R (Ground Signal Test Area), Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: February 8, 2017
Bate Stamp: 00737046 – 00737220

L. Title: Report - Draft Final 2nd Annual Remedial Action Operation Report for LHAAP-67, Above Ground Storage Tank Farm, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: February 10, 2017
Bate Stamp: 00737221 – 00740903

M. Title: Meeting Minutes – Longhorn Army Ammunition Plant Monthly Managers' Meeting Minutes
Author(s): AECOM Technical Services
Recipient: All Stakeholders
Date: February 23, 2017
Bate Stamp: 00740904 – 00740931

N. Title: Memorandum for Record - Groundwater Geochemistry Rebound Evaluation for LHAAP-35B(37), Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: February 28, 2017
Bate Stamp: 00740932 – 00741008

O. Title: Report - Draft Final 3rd Annual Remedial Action Operation Report for LHAAP-46, Plant 2 Area, Longhorn Army Ammunition Plant, Karnack, Texas
Author(s): AECOM Technical Services
Recipient: U.S. Army Corps of Engineers
Date: March 15, 2017
Bate Stamp: 00741009 – 00746804

	Bate Stamp:	00746805 – 00746881

AECOM

Subject:	**Final Minutes, Quarterly Restoration Advisory Board (RAB) Meeting, Longhorn Army Ammunition Plant (LHAAP)**
Location of Meeting:	**Karnack Community Center, Karnack, Texas**
Date of Meeting:	**October 20, 2016, 6:00 – 7:30 PM**

Meeting Participants:

LHAAP/BRAC:	Rose M. Zeiler
USACE:	Aaron Williams
USAEC:	Nicholas Smith
AECOM:	Debra Richmann, Marwan Salameh, Elspeth Sharp
USEPA Region 6:	Janetta Coats, Kent Becher (USGS Liaison)
TCEQ:	April Palmie
USFWS:	Paul Bruckwicki
RAB:	**Present:** Paul Fortune, Terry Britt, Judy VanDeventer, Charles Dixon, Richard Le Tourneau, John Pollard, Jr. **Absent:** Ken Burkhalter, Carol Fortune, Lee Guice, Ted Kurz, James Lambright, Nigel R. Shivers, Tom Walker
Public:	Dan Murphy, Rick Lowerre, Carl Turner

An agenda for the RAB meeting, three handouts (Groundwater Treatment Plant [GWTP] – Processed Groundwater Volumes, Harrison Bayou and Goose Prairie Creek – Perchlorate Data, and LHAAP Perimeter Well Monitoring – Perchlorate Data), four Fact Sheets (selected remedies for LHAAP-001-R, LHAAP-003-R, LHAAP-16 and LHAAP-17), responsiveness summaries from each of the Final RODs for LHAAP-001-R, LHAAP-003-R, LHAAP-16, LHAAP-17, and a color copy of the AECOM slide presentation were provided for meeting attendees. In addition, RAB application forms were available at the sign-in table.

Welcome and Introduction

Mr. Paul Fortune, RAB Co-Chair, called the meeting to order.

Mr. Fortune introduced Mr. Dan Murphy and Dr. Carl Turner. Dr. Rose Zeiler said that if they wished to serve on the RAB, there were paper applications at the sign-in table.

Mr. Fortune stated that he noticed there was an announcement in the paper that was a long list of sites for the Army Ammunition Plant, but that he did not see the RAB October 2016 meeting announcement in the newspaper. Dr. Zeiler and Ms. Debra Richmann were surprised; they did

not know what the list of sites that Mr. Fortune referred to seeing in the newspaper was. Ms. Richmann explained that the RAB October 2016 meeting announcement and the Notice of Availability of Final RODs were published in the Marshall News Messenger on October 13, 2016. Additionally, the October 2016 RAB Meeting was publicized in numerous locations including PSAs at three radio stations and two TV events calendars. Also, churches in Karnack were mailed RAB announcements on October 7, 2016, and RAB Meeting fliers were posted at multiple locations in the community. RAB meeting notices and releases of Final RODs were also sent to State, Federal and local officials and local groups. Outreach is summarized on Slide 4 of the presentation materials. Dr. Zeiler considered that the announcement Mr. Fortune saw that included a long list of sites may have been associated with an Army Ammunition Plant in Louisiana.

Open Items - Dr. Rose M. Zeiler

RAB Administrative Issues

Membership Update

Dr. Zeiler discussed the July meeting decision that the RAB membership list be updated to remove those no longer interested in serving. On October 11, 2016, letters were sent to RAB members that have not attended a RAB meeting since 2014. The letters asked members who wished to remain on the Board to contact a RAB member or one of the Co-Chairs on or before the date of the next meeting to express continued interest. Copies of the letters were provided to the RAB members that were in attendance. Letters were sent to the following individuals: Mr. Ken Burkhalter, Mr. Robert Cargill, Mr. Walter Lee Guice, Mr. Ted Kurz, and Mr. Jim Lambright. Recipients of the letters did not express interest to remain on the Board. Mr. Fortune made a motion to remove the inactive members from the Board. Mr. John Pollard Jr. seconded the motion. The abovementioned inactive members will be removed from the Board.

Minutes

Dr. Zeiler asked the RAB members if anyone wanted to make a motion to approve the minutes from the July 2016 RAB meeting. Mr. Richard LeTourneau made a motion to accept the July 2016 minutes and Mr. Fortune seconded the motion. The approved July 2016 RAB minutes will be posted on the LHAAP website.

Meeting Schedule

Dr. Zeiler asked if the standard RAB meeting time (third Thursday of every month) should be changed since it conflicts with Water Board meetings. Two RAB members, Mr. Terry Britt and Ms. Judy VanDeventer are Water Board members. Mr. Fortune asked that the conversation be postponed until Ms. VanDeventer could participate in the discussion; Ms. VanDeventer arrived later to the RAB meeting because she had to attend the Water Board meeting. Later, after Ms. VanDeventer had arrived, discussion on this topic continued. Mr. Pollard stated that he had a conflict with moving the RAB meetings to Tuesdays. Moving the RAB meeting start time to later in the evening was discussed, but was not favorable. Several attendees indicated Mondays

were not suitable due to travel constraints. Ms. VanDeventer and Mr. Britt stated that they would change the regular meeting time of the Water Board meetings to not conflict with the RAB meetings. Ms. VanDeventer and Mr. Britt stated that keeping the RAB meetings the third Thursday of each month was their preference. The discussion concluded that there would be no change to the current RAB meeting schedule. Future meetings will remain on the third Thursday of each month starting at 6:00 p.m.

Website Update

Ms. Richmann said that the website was being updated for the third quarter of the year. Ms. Richmann also stated that in the future, the date for the next RAB meeting will be posted on the website farther in advance of the scheduled meeting.

Site-wide Environmental Restoration Issues – Dr. Zeiler and Ms. Richmann

Dispute Update

Dr. Zeiler discussed that the disputed RODs were finalized for LHAAP-16, LHAAP-17, LHAAP-001-R, and LHAAP-003-R. Copies of the responsiveness summaries from each of the Final RODs were available at the sign-in table, as well as a fact sheet on the ROD for each site. Complete copies of the Final RODs are available at the Marshall Public Library. In response to a question, Ms. Richmann clarified that compact disks with the RODs are at the library, not hard copies.

Ms. Richmann reviewed the remedy for LHAAP-16 (slides 11-13). The remedy includes maintenance of the existing landfill cap, land use controls, and in-situ enhanced bio-remediation, passive bio-barriers, and monitored natural attenuation for volatile organic compounds and perchlorate in groundwater. Mr. Fortune asked for clarification on why groundwater was to be returned to its potential beneficial uses as drinking water, “wherever practicable.” Dr. Zeiler responded that TCE can become trapped in the fine-grained soils and is not able to be treated in that situation, so remediation to drinking water standards might not be “practicable.”

Ms. Richmann reviewed the remedy for LHAAP-17 (slides 14-16). The remedy includes excavation and off-site disposal of soil contaminated with perchlorate and explosives; and extraction, land use controls, and monitored natural attenuation for groundwater contaminated with volatile organic compounds and perchlorate. The LUCs are to prevent human health and ecological exposure. Extracted groundwater goes to the groundwater treatment plant.

The remedial actions for the other two disputed ROD sites, LHAAP-001-R-01 (South Test Area/Bomb Test Area) and LHAAP-003-R-01 (Ground Signal Test Area) were also discussed by Dr. Zeiler and Ms. Richmann (slides 17 through 21). The main remedial technology for both sites is land use controls with limited groundwater sampling for perchlorate – three annual rounds at LHAAP-001-R-01 and a single round at LHAAP-003-R-01. Dr. Zeiler pointed out that signs are in place at the two MMRP sites that note the restrictions.

Post-ROD Schedule for Disputed ROD Sites

Dr. Zeiler discussed the post-ROD schedule for the four disputed ROD sites (slide 22). There is a big gap in the schedule where no draft reports will be submitted from December 2016 through February 2018 due to the follow-on contract award process. AECOM is working to complete reports by November 30, 2016, so that these reports will be available to contractors proposing on the follow-on contract as Government Furnished Information.

LHAAP-4 Draft Final Revised ROD

Ms. Richmann discussed that the Draft Final Revised ROD is undergoing review by EPA and TCEQ.

Updated Schedule

Dr. Zeiler discussed that AECOM is working to complete reports and plans by November 30, 2016, so that these documents may be available for contractors proposing on the follow-on contract. Reports will not be published after November 30, 2016, so that the current contractor does not have an unfair advantage during the upcoming procurement process. The Army plans to issue the request for proposals for the follow-on contract December 1, 2016. The contracting process has to follow federal acquisition regulation (FAR) requirements.

1,4-Dioxane Confirmation Sampling at LHAAP-18/24

Mr. Charles Dixon had previously asked about 1,4-dioxane results at LHAAP-18/24. Ms. Richmann provided a brief recap of the initial round of 1,4-dioxane sampling at LHAAP-18/24, which was performed in October/November 2015. She said the purpose of the second round of sampling performed in June 2016 was to confirm the first round results and determine if a contingency remedy for 1,4-dioxane in groundwater will be needed. In June, a total of 52 monitoring wells at the site were sampled. Detected concentrations exceed the TRRP Tier 1 groundwater residential PCL in samples from six wells during the 2015 event and from four of the wells that were resampled in June 2016. The extent of 1,4-dioxane is limited (slide 28).

Mr. Britt asked if 1,4-dioxane will be treated by the current groundwater treatment plant at the site. Dr. Zeiler said a big driver of revising the FS for this site is to recognize 1,4-dioxane as a contaminant of concern at the site and to identify a contingency remedy. The contingency remedy will be put in place if 1,4-dioxane is not addressed by the remedy implemented to address the other contaminants of concern at the site. Ms. April Palmie added that the groundwater treatment plant is running, which also keeps the groundwater plume controlled and prevents migration.

Defense Environmental Restoration Program (DERP) Update – AECOM (Debra Richmann)

MNA Site Updates (LHAAP-37, 46, 50, 58, 67)

Ms. Richmann provided an overview of the current status of the MNA sites at LHAAP (Slide 29). Dr. Zeiler and Ms. Palmie explained that sampling at LHAAP-37 is discontinued. The Army is waiting for the site to return to baseline conditions, following the Bio-Plug testing, before beginning the quarterly MNA monitoring.

LHAAP-29 Update

Ms. Richmann updated the current status of LHAAP-29, indicating that the Draft RI Addendum has now been reviewed by TCEQ and EPA, and responses to the agency comments were submitted. The RI Addendum was approved by EPA with TCEQ concurrence in August 2016. The FS addendum is in preparation.

LHAAP-18/24 Update

Ms. Richmann updated the current status of LHAAP-18/24 (slide 31). A Draft Revised FS was submitted to EPA and TCEQ for review on October13, 2016. Submittal of the revised FS was originally scheduled for the spring of 2017, but it was expedited due to the follow-on contract procurement schedule.

LHAAP-47 Plant Area 3 Update

Dr. Zeiler explained that Army coordinated its plan to reassess groundwater conditions to get a good understanding of current site contamination. The additional data will be collected to inform the existing Draft Final ROD before it is finalized. The Post-Screening Investigation Work Plan was approved by EPA with TCEQ concurrence on September 30, 2016. However, due to time constraints, the actual investigation will be completed under the next PBR contract.

Groundwater Treatment Plant (GWTP) Update

Dr. Salameh provided an update on the LHAAP GWTP operations. Dr. Salameh was asked by Mr. Lowerre of Caddo Lake Institute what caused occasional perchlorate excursions observed during 2016. Dr. Salameh responded that the excursions were caused by varying factors including low nutrient concentrations and low temperature in the winter that affects biomass viability. Mr. Lowerre then asked what other factors there might be and Dr. Salameh indicated that perchlorate feed concentrations, rainfall and quantity of flow and levels of dissolved oxygen and nitrate could affect performance as well. Mr. Lowerre asked how we use this information to avoid future excursions. Dr. Salameh explained that future excursions are prevented by understanding what has caused issues in the past and making adjustments to prevent future excursions. Ms. Palmie further explained that the reactor beds, which are part of the remedy at the groundwater treatment plant, have their own contained ecosystem that is treating the perchlorate. AECOM samples the nutrients, dissolved oxygen, oxidation-reduction potential,

and pH, and also knows the nutrients that are being added into the system on a regularly scheduled basis. Dr. Salameh stated 800,000 to 1.2 million gallons are treated per month.

Surface Water and Perimeter Well Sampling Update

Ms. Richmann showed the slides with the surface water and perimeter well sampling locations (slide 35). Perchlorate was not detected in any of the samples collected in August 2016 from Harrison Bayou or GPW-1. A trace amount was detected in the sample from GPW-3 (0.141 µg/L), which is below the screening criteria (TRRP Tier 1 groundwater residential PCL of 17 µg/L). Mr. Britt noticed a spike on the graph (slide 36). Ms. Palmie clarified that the spike occurred in August 2009, before the source of the perchlorate was removed.

Groundwater samples were collected in June from the six perimeter wells. Perchlorate was not detected in four of the wells, 108, 110, 111, and 112. Perchlorate was detected below screening criteria (TRRP Tier 1 groundwater residential PCL of 17 µg/L) at wells 133 and 134.

Dr. Zeiler noted that surface water sampling will no longer be necessary when the site remedies are implemented.

Vintage World War II Era and Post-World War II Era Photos

Old photos of the LHAAP were provided in the RAB presentation (slides 39 through 48). The first photo is of LHAAP-49.

Next RAB Meeting Schedule and Closing Remarks

The next RAB meeting will be held on **January 19, 2017,** at the same time (**6:00 – 7:30 p.m.**) at the Karnack Community Center.

Adjourn

Motion to adjourn was made by Mr. Fortune and seconded by Ms. VanDeventer.

October 2016 Meeting Attachments and Handouts:

- Meeting Agenda
- PowerPoint Presentation Slides
- Groundwater Treatment Plant [GWTP] – Processed Groundwater Volumes Handout
- Harrison Bayou and Goose Prairie Creek – Perchlorate Data Handout
- LHAAP Perimeter Well Monitoring – Perchlorate Data Handout
- LHAAP-16, Landfill 16 Selected Remedy Fact Sheet
- LHAAP-17, Burning Ground No. 2/Flashing Area Selected Remedy Fact Sheet
- LHAAP-001-R, South Test Area/Bomb Test Area Selected Remedy Fact Sheet
- LHAAP-003-R, Ground Signal Test Area Selected Remedy Fact Sheet
- LHAAP-16 ROD Responsiveness Summary
- LHAAP-17 ROD Responsiveness Summary
- LHAAP-001-R-01 and LHAAP-003R-01 ROD Responsiveness Summary

Ongoing Outreach - Notifications for October RAB Meeting

- Published RAB meeting announcement in Marshall News Messenger on October 13th
- Published Notice of Availability of Final RODs in Marshall News Messenger on October 13th
- Requested the following radio stations to air October RAB Meeting Public Service Announcement (PSA):
  - KMHT Radio 103.9 (Karnack)
  - 98 Rocks (Alpha Media, Shreveport) and
  - Kiss Country 93.7 (Town Square Media, Shreveport)
- Requested PSA to be placed on KTBS Channel 3 and KTAL Channel 6 TV Community/Local Events Calendar
- Sent RAB announcement/agenda by email or USPS to individual RAB members and other interested parties
- Mailed RAB announcement to churches in Karnack on October 7th
- Sent RAB notice and Final RODs news release to State, Federal and local officials and local groups
- Posted RAB Meeting Fliers at multiple locations in the community:
  - Shady Glade Café, Caddo Grocery, Fyffes Corner Store, Circle S Grocery, Run In Grocery, Family Dollar Store, Convenience Store at FM9 and FM199

AECOM

The Army Wants You to be Informed!

- The Army is committed to protecting human health and the environment; key to that commitment is engaging the community and increasing public participation in environmental restoration at LHAAP.
- You are encouraged to:
  - Attend RAB meetings and/or become a member of the RAB
  - Visit the Longhorn environmental website at www.longhornaap.com
  - Make suggestions for improving communication – the Army welcomes and appreciates community feedback

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R

- Copies of the Responsiveness Summaries from each of the Final RODs are available at the sign in table
- Complete copies of the Final RODs are available to the public at the Marshall Public Library, 300 S. Alamo, Marshall, Texas, 75670
  - Library hours are 10:00 A.M. to 8:00 P.M. Monday through Thursday, and 10:00 A.M. to 5:30 P.M. Friday and Saturday.
- For more information, contact Dr. Rose M. Zeiler, Longhorn Army Ammunition Plant, P.O. Box 220, Ratcliff, Arkansas, 72951; phone number 479-635-0110; e-mail rose.m.zeiler.civ@mail.mil.

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

Final ROD for LHAAP-16

- The Selected Remedy is **Maintenance of Landfill Cap, Land Use Controls (LUCs), In-Situ Enhanced Bio-remediation, Bio-barriers, and Monitored Natural Attenuation (MNA)**
- The Selected Remedy will achieve the following Remedial Action Objectives (RAOs):
  - Protection of human health and the environment by preventing exposure to landfill wastes;
  - Protection of human health and the environment by reducing leaching and migration of landfill hazardous substances into the groundwater;
  - Protection of human health by preventing human exposure to the contaminated groundwater;
  - Protection of human health and the environment by preventing COCs and COC by-products from migrating to Harrison Bayou at levels that cause surface water in Harrison Bayou to exceed surface water criteria; and
  - Return of groundwater to its potential beneficial uses as drinking water, wherever practicable
- A **Fact Sheet** that provides additional information on the Final LHAAP-16 ROD is available at the check in table

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

Final LHAAP-17 ROD

- The Selected Remedy is **Contaminated Soil Removal, Extraction and Treatment of Groundwater, MNA and LUCs**
- The Selected Remedy will achieve the following RAOs:
  - Protection of human health by preventing human exposure to contaminated groundwater and contaminated soil;
  - Protection of human health by preventing further potential degradation of groundwater from contaminated soil;
  - Protection of ecological receptors by preventing exposure to contaminated soil;
  - Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water; and
  - Return of groundwater to its potential beneficial uses as drinking water, wherever practicable
- A **Fact Sheet** that provides additional information on the Final LHAAP-17 ROD is available at the check in table

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

LHAAP-17, Burning Ground No. 2/Flashing Area

SELECTED REMEDY: Excavation and Offsite Disposal of Soil, Groundwater Extraction, Monitored Natural Attenuation and Land Use Controls

AECOM

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

LHAAP-17, Burning Ground No. 2/Flashing Area

SELECTED REMEDY: Excavation and Offsite Disposal of Soil, Groundwater Extraction, Monitored Natural Attenuation and Land Use Controls

AECOM

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

Final RODs for LHAAP-001-R and LHAAP-003-R

- The Selected Remedy is **LUCs and Limited Groundwater Monitoring**
- The Selected Remedy will achieve the following RAO:
  - Protection of human health and safety from explosive hazards that may have remained at the site after the Munitions and Explosives of Concern (MEC) removal action, and confirmation that perchlorate is still present in groundwater at levels below the chemical specific criterion
- Implementation of the LUCs will:
  - Prohibit development and use of the property for residential housing, schools, and child care facilities and playgrounds, and prohibit intrusive activities such as digging and any other activity that will result in explosive safety risks
  - Prohibit residential land use until it is demonstrated that the MEC no longer presents a threat to public/human safety
  - Restricts land use to non-residential until it is demonstrated that MEC no longer presents a threat to public/human safety; and
  - Prohibits intrusive subsurface activities, including digging, until it is demonstrated that MEC no longer presents a threat to public/human safety
- Implementation of Limited Groundwater Monitoring will confirm the perchlorate level is below the residential cleanup level (Texas Risk Reduction Program [TRRP] Tier 1 Groundwater Residential Protective Concentration Level [PCL] of 17 ug/L)
- **Fact Sheets** that provide additional information on the Final LHAAP-001-R and LHAAP-003-R RODs are available at the check in table

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

LHAAP-001-R, South Test Area/Bomb Test Area

SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

AECOM

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

LHAAP-001-R, South Test Area/Bomb Test Area

AECOM

Final RODs for Disputed Sites LHAAP-16, LHAAP-17, and LHAAP-001-R and -003-R (cont.)

LHAAP-003-R, Ground Signal Test Area

SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

AECOM

Post-ROD Schedule for the Four Disputed ROD Sites

- LHAAP-16
  - Draft Remedial Design (RD) submitted October 14, 2016
  - Draft Remedial Action Work Plan (RAWP) due February 13, 2018
- LHAAP-17
  - Draft Pre-Design Investigation WP submitted September 29, 2016
  - Draft Pre-Design Investigation Report due May 14, 2018
  - Draft RD due November 14, 2018
  - Draft RAWP due April 15, 2019
- LHAAP-001-R
  - Draft Land Use Control RD February 7, 2018
- LHAAP-003-R
  - Draft Land Use Control RD February 7, 2018

Revised Draft Final ROD for Dispute Impacted Site LHAAP-004

Draft Final Revised ROD for LHAAP-004

- The Selected Remedy is **Alternative 3** from the Proposed Plan – **Targeted In-Situ Bioremediation, Long-Term Monitoring (LTM), and LUCs**
- The Selected Remedy will achieve the following RAOs:
  - Protection of human health by preventing ingestion of groundwater contaminated with perchlorate;
  - Return groundwater to its potential beneficial use, wherever practicable, within a reasonable time period, give the site-specific conditions; and
  - Prevent groundwater contaminated with perchlorate from migrating into nearby surface water
- The Draft Final Revised ROD was submitted to EPA and TCEQ earlier this month (October) and is currently undergoing regulatory review

Dispute Impacted Sites

- Other Dispute Impacted Sites
  - LHAAP-03 – Building 722 Paint Shop
  - LHAAP-29 – Former TNT Production Area
  - LHAAP-47 – Plant Area 3
  - LHAAP-50 – Former Sump Water Tank

Updated Schedule, Environmental Contract Ending

- Current AECOM PBR contract ends September 30, 2017
- The deadline for remaining AECOM contract deliverables (reports and plans) is November 30, 2016. These include:
  - Final LHAAP-16 Remedial Design (RD)
  - Final LHAAP-17 Pre-Design Investigation (PDI) Work Plan
  - Final Supplemental to Updated LHAAP-18/24 PSI Report
  - Final LHAAP-18/24 Revised FS
  - Final LHAAP-37 Remedial Action Completion Report (RACR)
  - Final LHAAP-50 Year 1 and Year 2 RA-O Reports
  - Final LHAAP-67 Year 1 and Year 2 RA-O Reports
  - Final LHAAP-002 Year 1 Tech Memo (Oct 2015/Apr 2016)

Updated Schedule, Environmental Contract Ending (cont.)

- Groundwater monitoring will continue at select sites, and results from each event will be documented in a data validation package

- GWTP Operation and Maintenance, Perimeter Wells and Surface Water Sampling; and Mowing/LUC Monitoring will be performed throughout the remaining contract period of performance (September 30, 2017)

Results of 1,4-Dioxane Sampling at LHAAP-18/24

- **RECAP**
  - Groundwater samples were collected from 66 monitoring wells and 7 ICTs at LHAAP-18/24 in late October/early November 2015 to evaluate extent of 1,4-dioxane. 1,4-dioxane was detected (>1 ug/L) in 40 samples. The detected concentrations exceed the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) of 9.1 ug/L in samples from 6 wells (120, 18CPTMW23, AWD-1, MW-12, MW-14, and MW-16) and 4 ICTs (ICT-12E, 13A, 13B, and 14B)
- **1,4-Dioxane Confirmation Sampling Results**
  - In June 2016, a total of 52 monitoring wells at LHAAP-18/24 were sampled for 1,4-dioxane. 1,4-dioxane was detected (>1 ug/L) in 17 samples. The detected concentrations exceed the TRRP Tier 1 Groundwater Residential PCL in samples from four of the wells that were resampled (120, MW-7, MW-14, and MW-16).
  - The maximum 1,4-dioxane concentration detected in the first round of samples from the monitoring wells is 203 ug/L (well 120) vs. 220 ug/L (well 120) in the June 2016 confirmation sampling round. The overall maximum concentration (412 ug/L) was detected in the second round confirmation sample from MW14.
  - The distribution of 1,4-dioxane concentrations detected above the TRRP Tier 1 Groundwater Residential PCL is shown in the following figure.

LHAAP-18/24 First and Second Round Groundwater Confirmation Samples with 1,4-Dioxane Concentrations Above the TRRP Tier 1 Groundwater Residential PCL (9.1 ug/L)

Defense Environmental Restoration Program (DERP) Update

- **Monitored Natural Attenuation Sites Updates**
  - LHAAP-35B (37) – Chemical Laboratory
  - LHAAP-46 – Plant Area 2
  - LHAAP-50 – Former Sump Water Tank
  - LHAAP-35A (58) – Shops Area
  - LHAAP-67 – Aboveground Storage Tank Farm
- Land Use Control Boundary Surveys for groundwater use restriction are complete for all sites
- Final Remedial Action Completion Reports (RACRs) are complete for LHAAP-46, -50, 58, and -67; Draft Final Revised RACR for LHAAP-35B(37) currently undergoing regulatory review
- Year 1 Remedial Action Operation (RA-O) report for LHAAP-50 is undergoing regulatory review; and reports for LHAAP-46 and LHAAP-58 are final
- Year 2 RA-O report for LHAAP-50 is undergoing regulatory review; LHAAP-67 is drafted but not submitted; and reports for LHAAP-46 and LHAAP-58 are final
- Quarterly/Semi-Annual Groundwater Monitoring is ongoing at all sites except LHAAP-35B (37)
  - At LHAAP-35B(37), first quarterly sampling round completed in August; results to determine if quarterly sampling will continue

LHAAP-29 - Former TNT Production Area Update

- To address remedy design and implementation questions at the Draft Final ROD stage, the Remedial Investigation (RI) and Feasibility Study (FS) were re-opened to fill data gaps and a Supplemental Investigation was performed
- An RI Addendum based on the Supplemental Investigation results for LHAAP-29 was submitted to EPA and TCEQ and was approved by EPA with TCEQ concurrence in August 2016. The Final RI Addendum documents achievement of the following objectives:
  - Confirmed the extent of methylene chloride DNAPL in the Intermediate Zone groundwater
  - Confirmed the extent of VOC, perchlorate, and explosives contamination in the Shallow Zone groundwater
  - Determined there is no continuing source of VOC contamination in site soil
  - Characterized physical properties (resistivity, hydraulic conductivity, etc.) and microbial activity in Intermediate Zone to support further FS evaluation of remedial alternatives
- An FS Addendum, which incorporates the supplemental data in the Final RI Addendum to develop and evaluate an additional remedial alternative not included in the previous FS, is currently in preparation

LHAAP-18/24 Former Burning Ground No. 3 and Unlined Evaporation Pond Update

- To evaluate remedy alternatives for LHAAP-18/24, a Draft Revised FS was submitted to EPA and TCEQ and is currently undergoing review
- In addition to groundwater confirmation sampling results for 1,4-dioxane, the Revised FS incorporates the June 2016 semi-annual groundwater monitoring results for VOCs, perchlorate, and total metals
- The Revised FS also uses supplemental data obtained between February and June 2016, which is documented in the Draft Supplemental to the Updated Post-Screening Investigation Report, which includes:
  - DPT soil sampling at 17 locations and analysis for VOCs and perchlorate
  - Installation of seven additional monitoring wells (three screened in the Shallow Zone and four in the Wilcox Fm.), with soil samples collected from well borings to create a vertical profile of VOCs and perchlorate in the unsaturated zone
- Above information was used to prepare the Draft Revised FS for LHAAP-18/24, including contingency remedies for 1,4-dioxane, if necessary, which was submitted to EPA and TCEQ for review on October 13th

LHAAP- 47 Plant Area 3 Update

- Final LHAAP-47 Post-Screening Investigation Work Plan was reviewed and approved by EPA with TCEQ concurrence on September 30th
  - Objectives:
    - ✓ Re-assess VOCs and perchlorate in Shallow Zone and Intermediate Zone groundwater, and
    - ✓ Re-assess potential VOC- and perchlorate-contaminated groundwater contribution to surface water in Goose Prairies Creek and tributaries
  - Scope:
    - ✓ Collection of two grab groundwater samples from each of seven Shallow Zone soil borings and six Intermediate Zone soil borings, and analysis for VOCs and perchlorate;
    - ✓ Installation and development of 13 Shallow Zone monitoring wells and 4 Intermediate Zone monitoring wells
    - ✓ Re-development of existing wells and synoptic water level survey of all site wells
    - ✓ Collection and analysis of groundwater samples from the new wells and up to 30 existing Shallow Zone wells and 10 existing Intermediate Zone wells for VOCs, and/or perchlorate, plus additional constituents included in the ROD
    - ✓ Collection and analysis of four surface water samples for perchlorate and VOCs
- Post-Screening Investigation will be implemented under the next PBR contract

Groundwater Treatment Plant (GWTP) Update

- The GWTP continues to operate to contain the plume at LHAAP-18/24 and LHAAP-16
- Treated groundwater is returned to LHAAP-18/24 through the sprinkler array
- LHAAP-18/24 groundwater compliance monitoring continues per existing sampling plan
- Maintenance and repairs of wells, pumps, tanks, and ancillary equipment is on-going. No major repairs have occurred since the air stripper blower was replaced in January 2016
- The FBR had a number of instances of perchlorate above the effluent limit in 2016. The treated water was released to the burning grounds (no discharge to Harrison Bayou). Potential causes for these excursions were investigated and addressed

GWTP Update (continued)

Next RAB Meeting Schedule and Closing Remarks

- Third Thursday in January 2017 is the 19th
  - Next RAB Meeting would normally be held on January 19th from 6:00 – 7:30 pm at the Karnack Community Center. However, this day/time is creating a conflict with RAB members who also attend the Caddo Lake Water Supply Corporation meetings, which are held the third Thursday of the month
  - Discuss potentially changing the day the RAB meetings are held
- Other Issues/Remarks?

Longhorn Army Ammuntion Plant Map with Perimeter Well Locations

LHAAP-16, Landfill

SELECTED REMEDY: Cap Maintenance, Land Use Controls, In Situ Enhanced Bioremediation, Biobarriers, and Monitored Natural Attenuation

Site History

LHAAP-16 is a capped landfill located in the south-central portion of the Longhorn Army Ammunition Plant (LHAAP). The site encompasses approximately 20 acres, of which approximately 13 acres are covered by the landfill cap. The landfill was established in 1940s and was used for disposal of solid and industrial wastes until the 1980s when disposal activities were terminated. The Army and the USEPA signed a Record of Decision (ROD) in 1995 approving an interim remedial action which included the construction of a multilayer landfill cap that was completed in 1998. In 1996 and 1997, a groundwater extraction system was installed by the Army to prevent the groundwater plume from migrating to Harrison Bayou. After resolution of a dispute between Army and EPA in March 2016, the 2011 Draft Final ROD was revised and the final ROD was finalized in September with a selected remedy of Cap Maintenance, Land Use Controls (LUCs), In Situ Enhanced Bioremediation, Biobarriers, and Monitored Natural Attenuation (MNA).

Site Characteristics

Harrison Bayou runs along the northeastern edge of LHAAP-16. Much of the site is relatively flat, though land becomes steeper near Harrison Bayou. Surface drainage from LHAAP-16 flows mostly through small gullies and ditches to Harrison Bayou which discharges into Caddo Lake to the northeast of the site. The subsurface at the site is composed of medium plastic sandy silt, fine sands, and clay. The clay layers tend to separate the groundwater into shallow, intermediate, upper deep, and deep zones. The groundwater flow direction is northeast toward Harrison Bayou in the shallow, intermediate and deep zones, while flow direction is southeast toward Harrison Bayou in the upper deep groundwater zone. Groundwater flow between the landfill and Harrison Bayou is also influenced by the presence of an extraction well system.

Remedial Action Objectives (RAOs)

- Protection of human health and the environment by preventing exposure to landfill contents;
- Protection of human health and the environment by reducing leaching and migration of landfill hazardous substances into the groundwater;
- Protection of human health by preventing human exposure to the contaminated groundwater;
- Protection of human health and the environment by preventing COCs and COC by-products from migrating into Harrison Bayou at levels that cause surface water in Harrison Bayou to exceed surface water criteria and;
- Return of groundwater to its potential beneficial uses as drinking water, wherever practicable

Chemicals of Concern

In the groundwater, the COCs are trichloroethene [TCE], cis-1,2-dichloroethene [DCE], vinyl chloride [VC]), perchlorate, and five metals (arsenic, chromium, manganese, nickel and thallium).

Description of the Selected Remedy:

Cap Maintenance:
Maintenance and repair of the existing landfill cap.

LUCs include:
- preserve the integrity of the landfill cap, and restrict intrusive activities (e.g., digging) that would degrade or alter the cap, as long as the landfill waste remains at the site or until the levels of COCs allow for unlimited use and unrestricted exposure.
- restrict the use of groundwater to-environmental monitoring and testing only and restricting land use to nonresidential will remain in place until the levels of COCs in surface and subsurface soil and groundwater allow for unlimited use and unrestricted exposure.
- maintain the integrity of any current or future remedial or monitoring systems will remain in place until groundwater cleanup levels of COCs are met.
- prohibit groundwater use (except for environmental monitoring and testing) as a potable source will remain in place until the levels of COCs in soil and groundwater allow for unlimited use and unrestricted exposure.

In Situ Enhanced Bioremediation:
In situ enhanced bioremediation in the most contaminated portion of the shallow and intermediate groundwater zones to reduce contaminant mass and lower the contaminant concentrations.

Biobarriers:
Installation of a biobarrier in the downgradient portion of the contaminant plume to prevent contaminated groundwater from seeping into Harrison Bayou at concentrations that would cause surface water to exceed Texas Surface Water Quality Standards, the Safe Drinking Water Act (SDWA) maximum contaminant levels (MCLs), and in the absence of federal drinking water standards, cleanup levels based on Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Levels (PCLs). A second biobarrier will be installed at the edge of the landfill to control potential migration of volatile organic compounds (VOCs) from the landfill.

MNA:
MNA will be implemented for areas outside the influence of the active remedies to assure protection of human health and the environment by documenting that further reductive dechlorination is occurring within the plume and that contaminant concentrations are being reduced to cleanup levels. MNA will also be implemented in the areas of active remediation following successful implementation of in situ bioremediation and the biobarriers.

CERCLA Five Year Reviews and inspections of physical mechanisms at LHAAP-16.

LHAAP-17, Burning Ground No. 2/Flashing Area
SELECTED REMEDY: Excavation and Offsite Disposal of Soil, Groundwater Extraction, Monitored Natural Attenuation and Land Use Controls

Site History
LHAAP-17, known as the former Burning Ground No.2/Flashing Area, is located in the southeastern portion of LHAAP and covers approximately 4 acres. Historically, LHAAP-17 was used as a burning ground from 1959 through 1980. Materials burned included trinitrotoluene (TNT), photo flash powder, reject material from Universal Match Corporation and materials removed from the TNT Production Area (LHAAP-29) and the TNT Waste Disposal Area (LHAAP-32). It was also used as a flashing area to decontaminate recoverable metal byproducts. After resolution of a dispute between Army and EPA in March 2016, the 2011 Draft Final ROD was revised and the final ROD was finalized in September with a selected remedy of Excavation and Offsite Disposal of Soil, Groundwater Extraction, Monitored Natural Attenuation (MNA) and implementation of Land Use Controls (LUCs).

Site Characteristics
The surface features include two 184 foot by 305 foot cleared areas separated by a gravel access road. The site is covered with grass, scattered brush, and small trees. The topography is relatively flat. Harrison Bayou is located to the west and north of LHAAP-17 within approximately 1,200 feet of the site. The surface drainage flows to ditches along the boundaries of the site which flow into Harrison Bayou. The bayou discharges to Caddo Lake, a source of drinking water for several neighboring communities in Louisiana. Shallow zone groundwater is approximately 18 to 35 feet below ground surface (bgs), the intermediate zone is approximately 55 feet bgs and the deep zone is approximately 151 feet bgs. The predominant groundwater flow direction in the shallow and intermediate zones varies seasonally, but is generally to the northwest towards Harrison Bayou.

Remedial Action Objectives (RAOs)
- Protection of human health by preventing human exposure to the contaminated groundwater and contaminated soil;
- Protection of human health by preventing further potential degradation of groundwater from contaminated soil;
- Protection of ecological receptors by preventing exposure to the contaminated soil;
- Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water; and
- Return of groundwater to its potential beneficial uses as drinking water, wherever practicable.

Chemicals of Concern
In the soil, chemicals of concern (COCs) are explosives (2,4,6-trinitrotoluene [TNT], 2,4-dinitrotoluene [DNT], 2,6-DNT) and perchlorate (potential soil COC based on groundwater concentrations); and chemicals of potential ecological concern (COPECs) are explosives (2,4,6-TNT, 2,4-DNT, 2,6-DNT); dioxins (2,3,7,8-tetrachlorodibenzo-p-dioxin [TCDD] toxicity equivalence concentration [TEC]); and barium.

In the shallow groundwater zone, the COCs are perchlorate and volatile organic compounds (VOCs) (1,2-dichloroethane [DCA], 1,1-dichloroethene [DCE], cis-1,2-DCE, trichloroethene [TCE], and vinyl chloride [VC]). In the intermediate groundwater zone, the COCs are TCE and its daughter products (DCE and VC).

Description of the Selected Remedy:

Soil Excavation:
The excavation will remove explosives, barium and dioxin contamination for off-site disposal that is a direct risk to the hypothetical future maintenance worker, is a potential source of contaminant migration to groundwater, and poses a risk to ecological receptors.

Groundwater Extraction:
The desired outcome is to reduce perchlorate concentrations in the groundwater to 20,000 ug/L or lower during an operational period of 1.5 years at which point MNA is anticipated to be favorable.

Contingency Remedy for Groundwater Extraction:
If groundwater extraction does not reduce perchlorate levels to 20,000 ug/L in the 1.5 year extraction timeframe, the contingency remedy would implement in situ bioremediation.

MNA:
MNA begins following groundwater extraction activities and the performance objectives of MNA will be evaluated after 2 years.

Contingency Remedy for MNA:
If MNA is found to be ineffective, the contingency remedy would implement in situ bioremediation.

LTM:
If MNA is determined to be effective, monitoring will be conducted to evaluate the remedy performance and determine if the plume conditions remain constant, improve or worsen after the baseline is established.

Implementation of LUCs:
- restrict the use of groundwater to environmental monitoring and testing only and restricting land use to nonresidential will remain in place until the levels of COCs in surface and subsurface soil and groundwater allow for unlimited use and unrestricted exposure.
- maintain the integrity of any current or future remedial or monitoring systems will remain in place until groundwater cleanup levels of COCs are met.
- prohibit groundwater use (except for environmental monitoring and testing) as a potable source will remain in place until the levels of COCs in soil and groundwater allow for unlimited use and unrestricted exposure.

CERCLA Five Year Reviews until the levels of COCs in soil and groundwater allow for unlimited use and unrestricted exposure.

LHAAP-17, Burning Ground No. 2/Flashing Area

00634240

SELECTED REMEDY: Excavation and Offsite Disposal of Soil, Groundwater Extraction, Monitored Natural Attenuation and Land Use Controls

LHAAP-001-R, South Test Area/Bomb Test Area
SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

Site History

LHAAP-001-R, the South Test Area/Bomb Test Area, is located in the southern portion of LHAAP and covers an area of approximately 79 acres. LHAAP-001-R was constructed in 1954 and used for testing photoflash bombs produced at the facility until about 1956. During the late 1950s, illuminating signal devices were also demilitarized within pits excavated in the vicinity of the test pad. During the early 1960s, leaking production items may have been demilitarized by detonation. Leaking white phosphorus (WP) munitions were supposedly disposed of although no primary source documentation concerning this effort was located. A 1984 LHAAP Contamination Survey stated the area had been relatively inactive since the early 1960s and no disposal or testing activities were carried out in this area. LHAAP-001-R is co-located with Installation Restoration Program site LHAAP-27. LHAAP-001-R was identified as a munitions and explosives of concern (MEC) area of concern based on the visual confirmation of MEC. In 2008, a MEC removal action was conducted and LUCs were developed. A total of 384 MEC/material potentially presenting explosive hazard (MPPEH) items and 14 inert items were located and destroyed and a total of 22,139 pounds of munitions debris and 1,876 pounds of cultural debris were removed during the course of clearance. In addition, LUCs were developed that included restrictions against intrusive activities including digging; signage at the perimeter of the site; and an education program for future refuge visitors, staff, and volunteers. After resolution of a dispute between Army and EPA in March 2016, the 2011 Draft Final ROD was revised and the final ROD was finalized in September with a selected remedy of implementation of LUCs and limited groundwater monitoring for perchlorate, in addition to the completed removal action.

Site Characteristics

The topography slopes gently to the east and surface water runoff from the hillside flows generally to the southeast and into Harrison Bayou. Groundwater at the site was encountered between 7 and 9 ft below ground surface. Groundwater is topographically controlled with a general flow direction to the east toward the floodplain of Harrison Bayou. Sampling conducted by the USEPA and Army in 2009 resulted in a detection of perchlorate in one well at a concentration above the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) of 17 ug/L.

Remedial Action Objective (RAO)

- Protection of human health and safety from explosive hazards that may have remained at the site after the MEC removal action and confirmation that perchlorate is present in groundwater at levels below the chemical specific criterion

Description of the Selected Remedy:

Implementation of LUCs:

- to prohibit the development and use of the property for residential housing, elementary and secondary schools, and child care facilities and playgrounds, and to prohibit intrusive activities such as digging or any other activity which could result in explosive safety risks.
- to prohibit residential land use will remain in place until it is demonstrated that the MEC no longer presents a threat to public/human safety.
- to restrict land use to nonresidential will remain in place until it is demonstrated that the MEC no longer presents a threat to public/human safety.
- to prohibit intrusive subsurface activities, including digging, will remain in place until it is demonstrated that the MEC no longer present an explosive hazard

Limited groundwater monitoring:

Limited groundwater monitoring for perchlorate will confirm perchlorate level in groundwater is below the TRRP Tier 1 Groundwater Residential PCL which is the state remedial standard utilized in the absence of a federal drinking water standard.

Five Year Reviews will be conducted because explosive hazards may remain at the sites that do not allow for unlimited use and unrestricted exposure.

LHAAP-001-R, South Test Area/Bomb Test Area

00634242

SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

LHAAP-003-R, Ground Signal Test Area

SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

Site History

LHAAP-003-R, the Ground Signal Test Area, is located in the southeastern portion of LHAAP and covers an area of approximately 80 acres. LHAAP-003-R was used intermittently starting in April 1963 for aerial and on-ground testing and destruction of a variety of devices, including pyrotechnic signal devices, red phosphorus smoke wedges, infrared flares, illuminating mortar shells and cartridges, button bombs, and various types of explosive simulators. The site was also used intermittently over a 20-year period for testing and burn-out of rocket motors. From late 1988 through 1991, the site was also used for burn-out of rocket motors in Pershing missiles. Occasionally, leaking white phosphorus (WP) munitions were burned at the site as a demilitarization activity. LHAAP-003-R is co-located with Installation Restoration Program site LHAAP-54. LHAAP-003-R was identified as a munitions and explosives of concern (MEC) area of concern based on the reported presence of MEC. In 2008 MEC removal action was conducted and LUCs were developed. A total of 12 MEC/material potentially presenting explosive hazard (MPPEH) items and one inert item were located and destroyed and 6,880 pounds of munitions debris and 5,981 pounds of cultural debris were removed during the course of surface clearance. In addition, LUCs were designed that include restrictions against intrusive activities including digging; signage at the perimeter of the site; and education programs for future refuge visitors, staff, and volunteers. After resolution of a dispute between Army and EPA in March 2016, the 2011 Draft Final ROD was revised and the final ROD was finalized in September with a selected remedy of implementation of LUCs and limited groundwater monitoring for perchlorate, in addition to the completed removal action.

Site Characteristics

The site is located within the watersheds of Saunders Branch and Harrison Bayou. Both Saunders Branch and Harrison Bayou flow into Caddo Lake. Surface water runoff from the site is towards drainage ditches located alongside the circular dirt road forming the outer margin of the site. The ditches converge to the northeast and the southwest directing surface water to Saunders Branch and Harrison Bayou, respectively. The depth to groundwater at the site averages about 15 feet below ground surface with some seasonal fluctuations. The regional groundwater flow direction is to the north-northeast toward Caddo Lake; however, during periods of high precipitation the groundwater flow direction in the southwestern portion of the site diverts to the northwest towards Harrison Bayou. The additional groundwater sampling conducted by the USEPA and U.S. Army in 2009 indicated that perchlorate was detected in one well at a concentration below the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level (PCL) of 17 ug/L.

Remedial Action Objective (RAO)

- Protection of human health and safety from explosive hazards that may have remained at the site after the MEC removal action and confirmation that perchlorate is present in groundwater at levels below the chemical specific criterion

Description of the Selected Remedy:

Implementation of LUCs:

- to prohibit the development and use of the property for residential housing, elementary and secondary schools, and child care facilities and playgrounds, and to prohibit intrusive activities such as digging or any other activity which could result in explosive safety risks.
- to prohibit residential land use will remain in place until it is demonstrated that the MEC no longer presents a threat to public/human safety.
- to restrict land use to nonresidential will remain in place until it is demonstrated that the MEC no longer presents a threat to public/human safety.
- to prohibit intrusive subsurface activities, including digging, will remain in place until it is demonstrated that the MEC no longer present an explosive hazard

Limited groundwater monitoring:

Limited groundwater monitoring for perchlorate will confirm perchlorate level in groundwater is below the TRRP Tier 1 Groundwater Residential PCL which is the state remedial standard utilized in the absence of a federal drinking water standard.

Five Year Reviews will be conducted because explosive hazards may remain at the sites that do not allow for unlimited use and unrestricted exposure.

LHAAP-003-R, Ground Signal Test Area

00634244

SELECTED REMEDY: Land Use Controls and Limited Groundwater Monitoring

LHAAP-16

3.0 Responsiveness Summary

The Responsiveness Summary serves three purposes. First, it provides the U. S. Army, USEPA, and TCEQ with information about community concerns with the preferred alternative at LHAAP-16 as presented in the Proposed Plan. Second, it shows how the public's comments were considered in the decision-making process for selection of the remedy. Third, it provides a formal mechanism for the U.S. Army to respond to public comments.

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-16 through public meetings, the Administrative Record for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. **Section 2.3** discusses community participation on LHAAP-16, including the dates for the public comment period, the date, location, and time of the public meetings, and the location of the Administrative Record. The following documents related to community involvement were added to the Administrative Record:

- Transcript of the public meeting on October 19, 2010
- Presentation slides from the October 19, 2010 public meeting
- Written questions and comments from the public during the public comment period, and the U.S. Army response to those comments dated March 14, 2011.

3.1 Stakeholder Issues and Lead Agency Responses

This section responds to significant issues raised by stakeholders including the public and community groups that were received in written or verbal form.

Question/comment: The Army states that it could take 280 years to reduce groundwater contaminant concentrations to acceptable levels. It is not reasonable to propose plans that could require water quality monitoring, maintenance of the landfill cap, maintenance of the biobarriers, and maintenance of LUCs for such a length of time.

The Army should take steps to reduce the length of time that will be required to achieve acceptable contaminant concentrations. These steps could include: installation of an effective pump and treat system, modification of the proposed in-situ bioremediation system to cover a greater portion of the site and to operate until acceptable concentrations are achieved, thermal treatment (e.g., steam stripping), and elimination or reduction of the contaminant source by removing the landfill or reducing the mass of contaminants that it contains.

Response: Given the nature of the residual contaminants that are present at LHAAP-16, the length of time that will be required to achieve cleanup levels would be long for any of the remedial alternatives, whether treatment, migration control, or source control by removal.

It is believed that TCE was present within the landfill as DNAPL has dissolved into the groundwater at very high concentrations and migrated to the east (down-gradient of the landfill). This high concentration region acts as a secondary source of groundwater contamination. Although TCE may remain in the landfill, the landfill cover system has significantly reduced the driving force of recharge and added a degree of isolation to the remaining waste. Removal of the landfill would not affect the secondary source of groundwater contamination outside the landfill and would be a very large cost without corresponding benefit.

The LUCs restricting the use of groundwater will be highly effective as will be long term maintenance of the LUCs, given that the reasonably anticipated future use of the site is as a national wildlife refuge (i.e., Caddo Lake National Wildlife Refuge) and the owner a federal agency. Once the property is transferred into the refuge system, the property must be kept as a National Wildlife Refuge unless there is an act of Congress which removes the parcel or the land is exchanged in accordance with the National Wildlife Refuge System Administration Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974. A national wildlife refuge by its very nature includes physical access and use restrictions, and is subject to control and continual inspection by Refuge personnel. The LUCs will restrict access to the groundwater for purposes other than environmental testing until cleanup levels are met. Additionally, access of groundwater through well installations requires a permit from the Texas Department of Licensing and Regulation or Texas Water District authority. The department will be provided a copy of the county recordation that indicates the location of contaminated groundwater at the site and associated restriction.

Since LHAAP-16 is enclosed within a national wildlife refuge with no current or planned use of groundwater for human consumption, plume stability and protection of Harrison Bayou are key measures for evaluation of a remedial strategy. A detailed analysis of alternatives, including those with aggressive treatments, was conducted according to the evaluation criteria identified in the NCP (40CFR 300.430). Advantages, disadvantages, and trade-offs were considered as part of the evaluation process during the feasibility study (Jacobs, 2002). The suggested alternatives were considered in the FS and were not seen as sufficiently advantageous over the preferred alternative (Shaw, 2010).

Question/Comment: Groundwater contamination at LHAAP-16 is caused by contaminants being leached from wastes in the landfill. The landfill could continue to generate large amounts of contaminants for decades or centuries. The Army's preferred alternative does not attempt to reduce the length of time that the landfill will generate contaminants.

The Army should attempt to reduce the length of time the landfill will generate large amounts of contaminants. This could be done by 1) removing the landfill or 2) treating the landfill to reduce the mass of contaminants it contains (e.g., hot-spot removal, flushing with surfactants or solvents, bioremediation, vapor extraction).

Response: It is believed that TCE was present within the landfill as DNAPL has dissolved into the groundwater at very high concentrations and migrated to the east (down-gradient of the landfill). This high concentration region acts as a secondary source of groundwater contamination. Although TCE may remain in the landfill, the landfill cover system has significantly reduced the driving force of recharge and added a degree of isolation to the remaining waste. The biobarrier will be installed at the edge of the landfill to treat/remediate and thereby control potential migration of contaminants from the landfill. Removal of the landfill would not affect the secondary source of groundwater contamination outside the landfill and would be a very large cost without corresponding benefit. Since LHAAP-16 is enclosed within a national wildlife refuge with no current or planned use of groundwater for human consumption, plume stability and protection of Harrison Bayou are more important measures for evaluation of remedial alternatives than the time factor.

In 1998 a landfill system was placed over the site and was completed as part of an early Interim Remedial Action (IRA) in accordance with the USEPA presumptive remedy guidance under CERCLA for municipal landfills (EPA 540-F-93-035) and for military landfills (EPA 540-F-96-020). Capping as opposed to waste treatment or removal, is a presumptive remedy at landfills as it has been shown to be more appropriate in comparison to other remedies. The IRA was intended to be consistent with the final remedy and is considered a component of the final remedy being proposed for LHAAP-16.

Landfill removal and landfill source treatment alternatives were included in the comparative analysis of alternatives performed during the feasibility study (Jacobs, 2002) and during the generation of the proposed plan (Shaw 2010) for LHAAP-16. These remedial alternatives did not demonstrate increases in effectiveness that were balanced by their increased costs and short-term impacts.

Question/Comment: The Army's 280 year estimate of cleanup time due to natural attenuation is not based on solid evidence. It appears that the Army chose this number because it was the cleanup time calculated for natural attenuation of TCE at well 16WW16. However, a longer TCE cleanup time (492 years) was calculated for well 16WW12. In addition, contaminant concentrations in some wells are stable or increasing rather than decreasing (e.g., perchlorate in well 16WW12, and TCE in well 16WW36). The calculated cleanup time due to natural attenuation for these wells would be infinity.

The Army does not address the question of whether the remedial actions it has conducted at the site have affected the cleanup time calculations. That is, are the contaminant reductions seen at the site due to natural attenuation, the remedial actions, or both?

Response: The duration of 280 years was considered as a reasonable estimate based on the prior history of TCE concentrations at 16WW16. The wells with stable or increasing concentrations are in areas where treatment will be applied, or where biobarriers will cut off renewal of contaminants from upgradient areas. Implementing the remedy is expected to expedite attenuation rates, making them faster, so the worst case scenario at 16WW12 was not chosen as a representative case. Instead the second slowest measurable attenuation was used as an initial estimate for duration.

Contaminant reductions thus far are due to a combination of past actions and natural attenuation. Past actions have removed contaminant mass in some areas of the site and can thus be assumed to have reduced cleanup time in those specific areas, though there is insufficient historical data to quantify the extent of that reduction. The areas most affected in this way would be the capture zone of the extraction wells and a small area immediately down-gradient of the semi-passive biobarrier. The cleanup times at locations that are outside the immediate down-gradient vicinity of the semi-passive biobarrier and far from the extraction wells can be assumed to be outside any significant influence from either of those past actions. Most of the wells at the site (e.g., 16WW16, 16WW12, 16WW43, etc.) are outside those influences.

Question/Comment: The Army intends to evaluate the effectiveness of natural attenuation in a 28 month period following the installation of the biobarriers and the in-situ bioremediation system, and after groundwater extraction has been discontinued. This does not appear to make sense. The effects of the remedial actions will persist for some unknown period of time. How will the Army distinguish between the effects of the remedial actions, and the effects of natural attenuation?

Response: The application of biobarriers and bioremediation will be in discrete areas. The effectiveness of remedial actions will be evaluated for wells in those areas. MNA will be evaluated for wells that are outside the remedial action areas.

Question/Comment: The Army should clearly explain how it will determine whether natural attenuation is reducing contaminants concentrations at an acceptable rate.

Response: The Army intends to present details of the MNA remedy implementation in a remedial design for LHAAP-16. The regulatory guidance established by USEPA (1998) for MNA will be followed to demonstrate that natural attenuation is occurring.

Question/Comment: The passive biobarriers will intercept groundwater only in the shallow zone. However, the intermediate zone also contains high concentrations of contaminants. The Army should explain why it chose not to extend the passive barriers into the intermediate zone.

Response: Biobarriers were not extended into the intermediate zone because the intermediate zone does not intersect surface water in Harrison Bayou. The intermediate zone is deeper than the flowline elevation of the bayou. The highest recent COC concentrations in the intermediate zone are more than 10 times lower than recent COC concentrations in the shallow zone. Nonetheless, the intermediate zone will be addressed via bioremediation injections in the most contaminated locations that have been detected within that zone. MNA will be implemented for areas outside the influence of the active remedies. Monitoring will verify protection of human health and the environment by documenting that further reductive dechlorination is occurring within the plume, that the plume is not migrating, and that contaminant concentrations are being reduced to cleanup levels.

Question/Comment: The pumping of the extraction wells may be limiting the lateral expansion of the contaminant plume. After the extraction wells are shut down, the plume may expand such that it will flow around the ends of the down gradient biobarrier. The Army should consider this possibility in its final remedial design.

Response: There are no plans to remove the extraction system, just to turn it off. The extraction wells will be shut down after application of in situ bioremediation. In situ bioremediation is expected to greatly reduce contaminant concentrations in the application area, minimizing the migration of contaminants toward the biobarrier that will be installed near the bayou. The biobarrier at the landfill is expected to treat contaminated groundwater thereby controlling renewal of the plume at the landfill boundary. The biobarrier is a treatment remedy for contaminated groundwater and not a physical barrier to preventing flow of groundwater. The remnants of the plume are expected to attenuate over time, and groundwater monitoring will continue to check for future potential migration.

Question/Comment: Groundwater up-gradient of Harrison Bayou is highly contaminated, and the contaminant plume emanating from the landfill is discharging to Harrison Bayou. However, there is no reason to believe that Harrison Bayou acts as a complete barrier to groundwater flow. A portion of the contaminant plume may extend beyond the bayou. The Army should install monitor wells to the east of Harrison Bayou to determine the full extent of groundwater contamination.

Response: Since 1999, the Army has collected quarterly surface water samples from three locations in Harrison Bayou. During August 2003 and August 2007, perchlorate was detected in the surface water samples collected from one sampling location in Harrison Bayou (HBW-1) indicating there is some discharge by seepage into Harrison Bayou. Except for the 2 quarters, perchlorate was not detected in any other samples during any other sampling events.

Many wells exist on the east side of Harrison Bayou. The pair of wells closest to the east is 18WW10 (shallow) and 18WW11 (intermediate), which show no COC contamination.

Question/Comment: The proposed monitor well network will not detect contaminants that flow to the southeast of the down gradient barrier. The Army should install at least one shallow and one intermediate monitor well between the southeast end of the barrier and Harrison Bayou.

The proposed monitor well network does not include an intermediate monitor well between the down gradient barrier and Harrison Bayou. The Army should install an intermediate monitor well next to well 16WW40.

The proposed monitor well network will not detect contaminants that flow thorough the northern portion of the down gradient barrier. The Army should install at least one shallow and one intermediate monitor well between the northern portion of the barrier and Harrison Bayou.

The extent of the contaminant plume in the shallow aquifer north of well 16WW22, and in the intermediate aquifer north of well 16WW41, is unknown. The Army should install at least one shallow well and one intermediate monitor well to the north of these wells.

Response: The need for installation of additional monitoring wells will be evaluated during the remedial design.

Question/Comment: The Army Corps of Engineers determined that the eastern portion of the site is within the floodplain of Harrison Bayou. It is not clear, however, whether any portion of the landfill itself is in the floodplain. The Army should determine whether any portion of the landfill is within the floodplain. If it is, steps should be taken to protect the landfill from the effects of flooding.

Response: The southeastern edge of the landfill is within the floodplain (U.S. Department of Housing and Urban Development, Flood Hazard Boundary Map, Harrison County, Texas, Unincorporated Area, Community Panel Number 480847 0004 A, Effective date: September 6, 1977, Converted by Letter Effective 11/1/89). This was known at the time the record of decision was signed for design and construction of the landfill. The southeastern portion of the landfill was designed with a compacted soil berm to protect the cap from flood waters. Additionally, the landfill cap is inspected periodically and maintenance is performed as necessary. The design and the follow-up inspection/maintenance activities are expected to be sufficient to protect the landfill from the effects of flooding.

Question/Comment: The Army is proposing only one sampling point on Harrison Bayou near site 16. Thus, if contaminants are detected, the Army will not be able to determine whether they are coming from site 16 or from an upstream source. In addition, this single sampling point will

not detect any site 16 contaminants that enter Harrison Bayou downstream of the point. That is, it will not detect contaminants that may flow around the northern end of the biobarrier, or through the barrier if it fails to function as intended.

Response: Based on groundwater flow and the proximity of Harrison Bayou, sampling location HBW-1 is considered the location most likely to reveal contamination resulting from LHAAP-16. Continued sampling of HBW-1 or a nearby location will be required by the ROD for LHAAP-16. In accordance with a 1999 agreement between Army, TCEQ, and EPA, the Army currently collects quarterly surface water samples from HBW-1 plus two other locations in Harrison Bayou - HBW-10, which is upstream, and HBW-7, which is downstream. While the Army, TCEQ, and EPA might agree to alter the locations of HBW-7 and HBW-10 at some later date, perchlorate results over the last 10 years have indicated that HBW-1 is the location of greatest concern.

In addition, the selected remedy also includes a network of monitoring wells down gradient of the biobarrier in addition to the surface water sampling. Therefore, concentrations of groundwater that has the potential to enter into Harrison Bayou would be known.

Question/Comment: Although Harrison Bayou was not flowing on October 19, 2010, there was a pool of standing water in the streambed. This pool was about 30 feet upstream of well 16WW40, and in the same area as the seep that was sampled in 1995. The pool was approximately 20 feet long, three feet wide, and a few inches deep. This pooled water may be groundwater that has discharged to the streambed. During periods when Harrison Bayou was not flowing, the Army should monitor the streambed for pools of water. If they are present, they should be sampled. The Army should also monitor the banks of Harrison Bayou for seeps and should attempt to sample any that are discovered.

Response: Previous sampling of the standing water in Harrison Bayou indicated that in the past contaminated groundwater discharged by seepage into Harrison Bayou. Because the basis for sampling is protection of human health by protecting the surface water that flows through Harrison Bayou to Caddo Lake, continued sampling of standing water in pools will serve no purpose. Periodic sampling of surface water is already conducted on a quarterly basis at three locations in Harrison Bayou. The banks of Harrison Bayou will be inspected for locations of possible seeps.

Question/Comment: The Army performed a 'streamlined' Human Health Risk Assessment for Harrison Bayou at site 16. This risk assessment found that the excess lifetime cancer risk for dermal contact with Harrison Bayou surface water was 1.62×10^{-5}. This is higher than the lower bound (1.0×10^{-6}) of the EPA target risk range. The streamlined assessment did not estimate the human health risk from drinking the water, nor did it estimate the effects that the water could have on Caddo Lake. The Army stated that a full risk assessment of Harrison Bayou would be conducted as part of the Group 2 risk assessment. However, site 16 does not appear to have been included in

the Group 2 risk assessment. The Army should perform a full Human Health Risk Assessment for Harrison Bayou at site 16.

Response: The calculated risk from surface water ($1.62x10^{-5}$) was within the range of acceptable risk levels for excess lifetime cancer risk ($1x10^{-4}$ to $1x10^{-6}$). The Group 2 Risk Assessment included a risk assessment for Harrison Bayou and sampling location HBW-1, which is associated with LHAAP-16 was included as part of that assessment. Additionally the risk assessment report states "because the depth of this surface water body ranges from a few inches to a few feet, it is unlikely that it would be used to any significant extent for swimming; therefore, the incidental ingestion of surface water is not evaluated".

Question/Comment: Concentrations of antimony and thallium that exceed the EPA MCL are commonly detected in groundwater at site 16. However, the Army has not included antimony or thallium as contaminants of concern (COC). The Army should either include antimony and thallium as a COCs for groundwater at site 16, or explain why they are omitted.

Response: Antimony and thallium are commonly found in groundwater and were detected in groundwater at LHAAP-16. However, they were not found to be significant contributors to cancer risk or non-cancer hazard in groundwater at LHAAP-16 during the human health risk assessment conducted for the site (Jacobs, 2001). The detections of antimony and thallium were erratic and did not appear to represent a plume of contamination. Additionally, they were not detected above background levels in soil at the landfill. These factors indicated that their occurrence was unlikely to be associated with contamination from the landfill. The detections of antimony in groundwater were also within the range of groundwater background values at Longhorn AAP (Shaw, 2007) indicating antimony is naturally occurring at the site. Therefore, antimony has not been included in the list of contaminants of concern at the site. Since thallium does not have a background value and has had historically high detection limits (2003 and 2004 analytical results), additional groundwater sampling for thallium will be integrated into the RD phase for LHAAP-16.

Question/Comment: The Army is using reporting limits for thallium in groundwater that are higher than the EPA MCL. Thus, concentrations of thallium that exceed the MCL may be undetected or unreported. The Army should use a thallium reporting limit that is less than the MCL.

Response: Given the results from 1997 (which had appropriate detection limits) and the lack of significant soil results, the U.S. Army considered thallium in the LHAAP-16 groundwater samples to be naturally occurring sporadic detections that were unrelated to site contamination. However, the Army concurs that analytical results in 2003 and 2004 samples had high detection limits and drive the need for further evaluation of thallium. Thus, thallium will be added to the COC list and

will be the subject of additional groundwater monitoring. Monitoring results will be evaluated at the first five-year review to determine if any further monitoring for thallium is warranted.

Question/Comment: High concentrations of dioxins and/or furans have been detected in surface water and groundwater at site 16. However, neither dioxins nor furans are included as COCs for surface water or groundwater. The Army should either include dioxins and furans as COCs, or explain why they are omitted.

Response: The concentrations of dioxins/furans were evaluated as a composited value for total dioxins/furans based on relative toxicities of the individual chemicals. That composited value is the toxicity equivalent (TEQ), and it can be directly compared with the MCL for dioxin. The highest TEQ dioxin concentration was lower than the MCL, so dioxins/furans were not selected as a COC.

Question/Comment: The Army's compliance level for perchlorate in Harrison Bayou is 26 µg/L, which is TCEQ's groundwater medium specific concentration for residential use (GW-Res). However, the EPA's Health Advisory (HA) level for perchlorate is 15 µg/L. Although the HA is not an enforceable MCL, it is reasonable to assume that when it is finally established, the perchlorate MCL will be similar to the HA. The Army should explain why it did not use the HA level as the cleanup level.

Response: The cleanup level and surface water compliance level for perchlorate is 17 µg/L, which is the TRRP Tier 1 Groundwater Residential PCL. The cleanup level for perchlorate was revised as a result of dispute resolution between the Army and the EPA. If enforceable limits change in the future, or are newly introduced, the difference between the cleanup level and any such new limits will be subject for discussion during the five year reviews.

Question/Comment: The final details of the remedial action will be presented in a Remedial Design (RD). The Army should make the RD available for public review and comment as soon as it is developed. The Army's Proposed Plan does not mention the development of a contingency plan to be invoked if the remedial actions are not performing satisfactorily. A contingency plan should be included in the RD.

Response: The public will be provided with updates on remedial design and remedial action status through the RAB meeting and any concerns can be addressed through this forum. The RD will include performance objectives, schedule and other design criteria and will follow established regulatory guidance for MNA.

The concept of a contingency plan for what to do if the remedy is unsuccessful as implemented is inherent in the process of remediation. The remedy must be determined to be operating properly

and successfully. Other opportunities for implementing contingency plans will occur with each five-year review.

Question/Comment: The Army reported an average groundwater speed in the shallow zone of 36.7 ft/yr. However, groundwater speeds in the shallow zone range from 0.44 ft/yr - 990 ft/yr.

The higher values may be associated with paleochannels, while the lower values may be associated with ancient overbank deposits that border the paleochannels. When evaluating the transport of contaminants in groundwater, we are usually more concerned with the contaminants that flow most rapidly, rather than those that flow at average or lower speeds.

Response: Noted. The groundwater velocity is not directly measured, but is estimated from groundwater gradients and the average of hydraulic conductivities measured in individual wells. There can be considerable variability of hydraulic conductivity from well to well, so using the average hydraulic conductivity is reasonable for calculating the overall groundwater velocity for the entire site.

Question/Comment: Alternative 7 seems to be the path of least resistance rather than a proactive approach. It appears the Army is trying to do as little as possible for a very contaminated site and not fix the problems for LHAAP-16. The relative low cost was based on the Army's 30 year payout and the possible length of time to remediate the landfill is projected to be 280 years. More investigation should be conducted before finalizing the plans for Site 16 Landfill.

Response: More investigation is not considered necessary to understand the contamination and hydrogeology at LHAAP-16. Additional investigations are unlikely to alter the conclusions that have led to the development of remedial alternatives for the site. Delaying implementation of a remedy to perform more investigations would be less protective of human health than proceeding with the preferred remedy. Besides actively treating the more contaminated portions of the groundwater, the preferred remedy will require monitoring, control of groundwater use, and periodic review of the conditions of the site. The components of the remedy that apply to the more contaminated portions of the groundwater would be implemented within a few years – well within the 30 year period of the cost estimate. Due to the future land use, it is reasonable to utilize monitored natural attenuation to address the remaining contamination over a much longer time period. The preferred remedy has been deemed to be protective of the human health and the environment.

Question/Comment: The Army's proposal for dealing with this highly contaminated landfill consist mostly of future monitoring, periodic groundwater water treatment, and implementing some small barrier walls to hopefully slow down the migration of contaminated groundwater into nearby Caddo Lake. Unfortunately, this is already happening, although the Army claims to not

know to what extent. Site 16 landfill remedy has a projected cost of a little less than 2 million dollars for its proposed 30 year clean-up plan. The Army says it will possibly take 280 years to complete the site 16 landfill clean-up; this must indicate that the site is highly contaminated.

Response: A landfill cap and cover system was placed over the site and was completed as part of an early IRA. Landfill cap is a presumptive remedy for municipal landfills (USEPA, 1993) and for military landfills (USEPA, 1996). A landfill cap and cover system eliminated the direct exposure pathway to source area waste material, preventing contaminant transport to surface water via surface runoff, and reducing leaching of contaminants to the groundwater The IRA was intended to be consistent with the final remedy and is considered a component of the final remedy being proposed for LHAAP-16.

Rather than slowing the migration of the contamination, the proposed biobarriers and bioremediation injections are intended to destroy much of the identified contamination. The active remedies that apply to the more contaminated portions of the groundwater would be implemented first and followed by monitored natural attenuation. Due to the future land use, it is reasonable for the preferred alternative to utilize monitored natural attenuation to address the areas outside of the active remedies over a much longer time period.

Question/Comment: Does the Army have a plan for what it intends to do after the first 30 year segment of the clean-up project has been completed? Could it possibly be the same remedy continued, or a new plan at a much greater cost? Or, could it be that nothing will be done because the sands of time have by then washed away all the records and memory of site 16, leaving it for future generations to unknowingly suffer from and possibly have to deal with?

Response: The expectation at this time is that the remedy would continue. At the five-year reviews, the remedy is evaluated and adjusted or changed if necessary.

Question/Comment: The remediation cost is $183.00 per day for LHAAP-16 for 'no' removal of many "known" and "unknown" toxic chemicals buried at the site. Site 16 landfill has been determined by the EPA to be so contaminated it is listed as a Federally Funded Military Superfund Clean-up site. There are most likely metal containers of toxic chemicals buried at the site that will eventually rust through and cause additional soil and groundwater contamination beyond what is currently known or detected.

Response: A detailed analysis of several alternatives including landfill removal was conducted in accordance with the evaluation criteria identified in the NCP (40CFR 300.430). Advantages, disadvantages, and trade-offs were considered as part of the evaluation process during the feasibility study (Jacobs, 2002). The selected remedy for LHAAP-16 was preferred over other

alternatives because it provides the best combination of major trade-offs, is protective of human health and the environment and is compliant with regulatory requirements.

Question/Comment: Nearby Caddo Lake may eventually be home to this toxic waste since it is migrating through the soil and groundwater in that direction.

Response: The history of LHAAP-16 indicates the contamination migrates via groundwater flow, not through transport of soil. Contaminated groundwater does exist at LHAAP-16, but is not flowing into Caddo Lake. While sample results for Harrison Bayou surface water indicate that it is within the allowable water quality limits for the contaminants of concern, the groundwater near the bayou has elevated concentrations of those contaminants. The concern for preventing seepage of contaminants to the bayou was a significant factor in proposing a remedial action that includes a biobarrier to intercept that contamination.

3.2 Technical and Legal Issues

This section is used to expand on technical and legal issues. However, there are no issues of that nature beyond the technical issues already discussed in **Section 3.1**.

LHAAP-17

3.0 Responsiveness Summary

The Responsiveness Summary serves three purposes. First, it provides the U .S. Army, USEPA, and TCEQ with information about community concerns with the preferred alternative at LHAAP-17 as presented in the Proposed Plan. Second, it shows how the public's comments were considered in the decision-making process for selection of the remedy. Third, it provides a formal mechanism for the U.S. Army to respond to public comments.

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-17 through public meetings, the Administrative Record for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. **Section 2.3** discusses community participation on LHAAP-17, including the dates for the public comment period, the date, location, and time of the public meetings, and the location of the Administrative Record. The following documents related to community involvement were added to the Administrative Record:

- Transcript of the public meeting on June 29, 2010
- Presentation slides from the June 29, 2010 public meeting
- Written questions and comments from the public during the public comment period, and the U.S. Army response to those comments dated December 9, 2010.

3.1 Stakeholder Issues and Lead Agency Responses

This section responds to significant issues raised by stakeholders including the public and community groups that were received in written or verbal form. The figures that the commenter makes reference to were provided by the commenter.

Question/comment: The Army intends to stop pumping and treating groundwater once average perchlorate concentrations are reduced to 20,000 µg/L. According to the Army, high concentrations of perchlorate inhibit the natural attenuation of TCE. However, the Army has not presented any evidence to show that there are significant differences in the attenuation of TCE when the perchlorate concentration is below 20,000 µg/L. In fact, TCE concentrations are increasing at monitor wells 130 and 17WW03, even though perchlorate concentrations at these wells are well below 20,000 µg/L (see figures 1a, 1b, 2a, and 2b on the next page). On the other hand, perchlorate concentrations in monitor well 17WW06 are much higher than 20,000 µg/L, but TCE concentrations are decreasing (see figures 3a and 3b). Thus, there does not appear to be a strong relationship between perchlorate concentrations and the attenuation of TCE. The Army should not rely on a reduction in perchlorate concentrations to result in the attenuation of TCE.

Figure 1a Data source: United States Army, 2010a, appendix A, table A-1.

Figure 1b Data source: United States Army, 2010a, appendix A, table A-1.

Figure 2a Data source: United States Army, 2010a, appendix A, table A-1.

Figure 2b Data source: United States Army, 2010a, appendix A, table A-1.

Figure 3a Data source: United States Army, 2010a, appendix A, table A-1.

Figure 3b Data source: United States Army, 2010a, appendix A, table A-1.

Response: Studies of natural attenuation and guidance for implementing MNA presume that biologically assisted attenuation proceeds from the most easily reduced compounds to the ones that are most difficult. Perchlorate is more easily reduced than TCE. The microbes that metabolize perchlorate are ubiquitous in the natural environment, and there appears to be no potential "stalling" at daughter products (which can happen with TCE). The perchlorate concentration of 20,000 µg/L was selected based on data from LHAAP-17 and another site at Longhorn. At LHAAP-17, observation of the subsurface conditions is complicated by the perchlorate contaminated soil which may add perchlorate to the groundwater via percolation. The performance of natural attenuation to meet remedial action objectives will be evaluated after soil removal, groundwater pumping, and eight quarterly sampling events. If it is found that the performance objectives are not being met with natural attenuation, a contingent remedy such as in situ bioremediation would be implemented.

Question/comment: It appears that the Army intends to stop pump and treat once the trigger is reached, regardless of the effect that pump and treat is having on contaminant concentrations. This is not a reasonable approach to contaminant clean-up. The Army should evaluate the effectiveness of pump and treat when the trigger is reached. Then, if it is still having a substantial effect on contaminant concentrations, pump and treat should be continued. The pump and treat system should be operated as long as it is causing significant reductions in contaminant concentrations.

Response: The U.S. Army has chosen to implement pump and treat to reduce the highest contaminant concentrations at LHAAP-17 to make conditions more favorable for MNA. Contaminant removal by pump and treat methods operates with diminishing returns – as concentrations decrease, the mass removal rate also falls. Inevitably, a point is reached at which remediation by pump and treat is no longer cost effective. The pump and treat system in conjunction with the site hydrogeological conditions may also be considered ineffective if the system is incapable of reducing perchlorate concentrations at a rate that would be considered productive. As the wording in the comment implies, "substantial effect" and "significant reductions", there is some amount of interpretation involved in deciding when to turn off the pumps. However, pump and treat is not the primary remedy selected or evaluated for LHAAP-17. It is used to assist the primary remedy of MNA by reducing the highest contaminant concentrations. If the pump and treat does not effectively reduce the highest contaminant concentrations in the reasonable time allowed, a contingency remedy such as in situ bioremediation will be implemented.

Question/comment: TCE samples have been collected from 11 monitor wells in the shallow zone. TCE concentrations have exceeded the 5 µg/L MCL in six of these wells. Of these six wells TCE concentrations are rising in four, and dropping in two (see figures 1b, 2b, 3b, 4, 5, and 6). The table below shows the most recent TCE concentrations found in the six wells.

Clearly, natural attenuation is not acting to reduce TCE concentrations throughout the site. Although the Army claims that high concentrations of perchlorate are inhibiting the attenuation of TCE, this assertion is not supported by the data (see first comment). The Army should reevaluate its reliance on natural attenuation to reduce TCE concentrations at Site 17.

Most Recent TCE Concentrations in Shallow Zone Monitor Wells

Wells with increasing concentrations of TCE		Wells with decreasing concentrations of TCE	
Well ID	TCE (µg/L)	Well ID	TCE (µg/L)
130	31.1	17WW04	0.9
17WW01	6090	17WW06	176
17WW02	867		
17WW03	12.8		

Figure 4 Data source: United States Army, 2010a, appendix A, table A-1.

Figure 5 Data source: United States Army, 2010a, appendix A, table A-1.

Figure 6 Data source: United States Army, 2010a, appendix A, table A-1.

Response: The most significant increase in TCE concentrations is seen at well 17WW01 between 1998 and 2004. TCE concentrations have declined in this well since 2004. Increases in TCE concentrations at wells 130, 17WW02, and 17WW03 are not as significant and may reflect seasonal variations instead of an overall increase in mass. The groundwater gradient at LHAAP-17 is fairly flat and the diffusion of TCE away from 17WW01 may cause a rise in concentrations in the surrounding wells (i.e., 17WW02 and 17WW03). Even though there are fluctuations in the wells at LHAAP-17, the plume is bounded and there does not appear to be a significant migration of the plume. Additionally, pump and treat will contain the plume and will reduce TCE concentrations (prior to MNA evaluation) as well as the perchlorate.

Under current conditions at LHAAP-17, with the addition of perchlorate from contaminated soil by percolation, natural attenuation cannot be effectively evaluated since the high perchlorate concentrations are inhibiting TCE attenuation. After contaminated soil is removed, groundwater pumping will still disturb natural conditions. It is only after soil is removed and pumping is stopped that an effective MNA evaluation may be made. When that evaluation is complete, and if it is favorable, MNA will continue as the remedy. However, if the evaluation is not favorable, another remedy (e.g., in situ bioremediation) will be implemented to reduce the TCE concentrations.

Question/comment: The Army estimates that natural attenuation will reduce TCE concentrations in the shallow groundwater zone to the clean-up level (5 µg/L) in less than 120 years. It is not reasonable to propose a plan that could require the maintenance of LUCs for a century.

Response: The reasonably anticipated future use of the site is as a wildlife refuge (i.e., Caddo Lake National Wildlife Refuge). Once the property is transferred into the refuge system, the property must be kept as a National Wildlife Refuge unless there is an act of Congress which removes the parcel or the land is exchanged in accordance with the National Wildlife Refuge System Administration Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974. This proposed transfer as a national wildlife refuge, which by its very nature includes physical access and use restrictions, is subject to control and continual inspection by Refuge personnel. Also, the property is intended to remain under ownership and management of a federal government agency. The LUC for groundwater will prohibit access to the groundwater except for environmental testing until cleanup levels are met. Maintenance of the LUC for groundwater use prohibition would require minimal effort and would be reasonable for extended lengths of time. Effectiveness of the LUC will be evaluated as part of the statutory five-year reviews and does not pose additional burden. Additionally, access of groundwater through well installations requires a permit from the Texas Department of Licensing and Regulation or Texas Water District authority. The department will be provided a copy of the county recordation that indicates the location of contaminated groundwater at the site and associated prohibitions.

Question/comment: The clean-up time estimate is based on data from monitor well 17WW06, where TCE concentrations are declining (see figure 3b). However, this estimate does not apply to those portions of Site 17 where TCE concentrations are increasing (see third comment). The Army should provide an estimate of clean-up time for the entire site.

Response: Although there is some uncertainty associated with the cleanup time for the entire site because of the inhibitive effects of perchlorate, the data collected during the two year period of natural attenuation monitoring (post pump and treat) will be used to remove some of the uncertainties associated with the estimate of time to achieve MCLs. The statutory five-year reviews will evaluate the effectiveness of the remedy and estimated durations to reach MCLs and would recommend implementation of other measures if needed.

Question/comment: The Army estimates that natural attenuation will reduce perchlorate concentrations to the clean-up level (17 µg/L) within approximately 15 years. This estimate is based on perchlorate degradation rates (half-lives) calculated for eight monitor wells. However, the Army did not calculate degradation rates for two monitor wells that currently contain high perchlorate concentrations: well 17WW01 (56,000 µg/L) and well 17WW02 (160,000 µg/L). Over the entire period of record, perchlorate concentrations in these two wells have increased, although concentrations in both wells are currently decreasing (see figures 7 and 8). Wells 17WW01 and 17WW02 are important data points that the Army has not accounted for in its estimate. The Army should explain why it did not use data from these wells to estimate the clean-up time for perchlorate at Site 17.

Figure 7 Data source: United States Army, 2010a, appendix A, table A-1.

Figure 8 Data source: United States Army, 2010a, appendix A, table A-1.

Response: Data from wells 17WW01 and 17WW02 were not used because those two wells appear to be receiving additional perchlorate as it leaches into groundwater from the overlying contaminated soil. The removal of contaminated soil will end this influx, and the pump and treat activity will reduce perchlorate concentrations in the groundwater at those two wells (to

20,000 µg/L). As the perchlorate concentration at 17WW06 (74,000 µg/L) is significantly higher, the U.S. Army feels that the cleanup time estimated for perchlorate at 17WW06 by MNA provides a reasonable estimate.

Question/comment: The Army does not consider perchlorate to be a COC in the intermediate groundwater zone. However, high concentrations of perchlorate have been detected in intermediate zone monitor well 17WW11. Therefore, perchlorate should be a COC in the intermediate zone.

Response: Well 17WW11 is considered a shallow-intermediate well. There was no distinct clay layer to separate the shallow and intermediate zones. Boring logs for it and surrounding wells were inspected along with groundwater elevations, and it appears to be more reasonably connected with nearby shallow zone monitoring wells than with nearby intermediate zone monitoring wells. As a result, the well 17WW11 has been included with the shallow wells, and within the defined perchlorate plume. Also, perchlorate concentrations were below the detection limit in the intermediate groundwater zone wells (17WW07, 17WW09, 17WW15, and 17WW17).

Question/comment: The Army will present details of the soil excavation plan, the pump and treat system, the groundwater remediation performance objectives, the plan for implementing and evaluating MNA, and the LUC implementation plan, in the RD. However, the RD has not yet been produced. Given its importance, the Army should make the RD available for public review and comment as soon as practicable.

Response: The public will be provided with updates on remedial design and remedial action status through the RAB meeting and any concerns can be addressed through this forum. The RD will include performance objectives, schedule and other design criteria and will follow established regulatory guidance for MNA.

3.2 Technical and Legal Issues

This section is used to expand on technical and legal issues. However, there are no issues of that nature beyond the technical issues already discussed in **Section 3.1**.

LHAAP-001-R-01 and -003-R-01

3.0 Responsiveness Summary

The Responsiveness Summary serves three purposes. First, it provides the U .S. Army, USEPA, and TCEQ with information about community concerns with the remedy at LHAAP-001-R and LHAAP-003-R as presented in the Proposed Plan. Second, it shows how the public's comments were considered in the decision-making process for selection of the remedy. Third, it provides a formal mechanism for the U.S. Army to respond to public comments.

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-001-R and LHAAP-003-R through public meetings, the Administrative Record file for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. **Section 2.3** discusses community participation on LHAAP-001-R and LHAAP-003-R, including the dates for the public comment period, the date, location, and time of the public meetings, and the location of the Administrative Record. The following documents related to community involvement were added to the Administrative Record:

- Transcript of the public meeting on July 21, 2011
- Presentation slides from the July 21, 2011 public meeting
- Questions and comments from the public during the public comment period, and the response to comments from the U.S. Army dated July 27, 2011.

Written comments were received from the general public during the public comment period and Proposed Plan meeting in July 2011 for LHAAP-001-R and LHAAP-003-R. The Proposed Plan was finalized without revision. **Appendix A** contains the public announcement for the Proposed Plan meeting and public comment period.

3.1 Stakeholder Issues and Lead Agency Responses

This section responds to significant issues raised by stakeholders including the public and community groups that were received in written or verbal form.

Question/comment: High concentrations (greater than the MCL) of metals have been found in groundwater at both sites since the early 1980s. In the most recent round of groundwater sampling (2009), high concentrations of beryllium and chromium were detected at site 001-R, and high concentrations of arsenic and chromium were detected at site 003-R.

However, the Army does not intend to monitor metals in groundwater at either site. This is despite the fact that the EPA sent the Army a letter that recommended monitoring metals in groundwater. Letters between the EPA and Army are reproduced in appendix 1.

The Army should monitor metals in groundwater at both sites.

Response: Perchlorate and white phosphorus (WP) are the data gap contaminants of concern for LHAAP-001-R and LHAAP-003-R under the Military Munitions Response Program (MMRP). Metals were addressed at sites LHAAP-27 and LHAAP-54, which are co-located with LHAAP-001-R and LHAAP-003-R respectively, under the 1998 Installation Restoration Program (IRP) ROD. Therefore any metals issues/concerns for these two sites must be addressed with respect to the 1998 IRP ROD and would not be included in this Proposed Plan. Army is in the process of reviewing the new metal results and historical results and has committed to respond to EPA and TCEQ under a path separate from the MMRP.

Question/comment: Soils at sites 001-R and 003-R are contaminated with a variety of metals (e.g., arsenic, barium, cadmium, lead). However, the Army does not plan to remove contaminated soil from either site.

According to the Army, the contaminants do not represent a threat to human health. However, there are problems with the Army's human health risk assessment (HHRA).

First, many of the soil analyses are not useful because of high detection limits (see below).

Second, the HHRA was performed in 1997. Therefore, it did not use the most recent data. The more recent data shows that some metal concentrations are significantly higher than those used in the HHRA (**Table 3-1**). Also, perchlorate was not included in the HHRA.

Table 3-1
Contaminant Concentrations Used in HHRA
Old and New Maximums

Contaminant/Site	Old Maximum (mg/kg)	New Maximum (mg/kg)
Barium/001-R	123	639
Copper/001-R	18.7	41.1
Lead/001-R	18	26.3
Nickel/001-R	2.41	18.6
Thallium/003-R	-	0.2
Perchlorate/001-R	-	28.9 (µg/kg)

The Army should remove contaminated soils from both sites.

Response: Please see response to the first comment above.

Question/comment: In some cases, the Army used detection limits for metals in soil and sediment that are higher than the standards established to protect human health (see **Table 3-2**). Thus, the Army cannot know whether these contaminants are present in concentrations that threaten human health.

Table 3-2
Detection Limits for Metals in Soil and Sediment

Contaminant	Site	Date	Detection Limit (mg/kg)	Standard (TCEQ GWP-Ind, mg/kg)
Antimony	001-R & 003-R	1982	0.76	0.6
	001-R & 003-R	1993	1	0.6
	001-R	1994	1.1-1.3	0.6
	001-R	1996	10.3-10.9	0.6
	003-R	1996/1997	1.1-1.2	0.6
Arsenic	001-R & 003-R	1982	0.3	1
	001-R & 003-R	1993	0.1-1	1
	001-R	1996	2.58-2.74	1
	003-R	1996/1997	0.596-58.7	1
	001-R & 003-R	2003	0.52-0.54	1
Beryllium	001-R & 003-R	1982	0.5	0.4
	001-R	1997	0.62-0.77	0.4
	001-R & 003-R	2003	0.20-0.22	0.4
Cadmium	001-R & 003-R	1982	0.5	0.5
	001-R & 003-R	1993	1	0.5
	001-R	1994	0.56-0.63	0.5
	001-R	1996	2.06-2.19	0.5
	003-R	1996/1997	2.22-2.38	0.5
	001-R & 003-R	2003	0.25-0.27	0.5
Thallium	001-R & 003-R	1982	3	0.2
	001-R & 003-R	1993	0.2	0.2
	001-R	1994	0.55-1.2	0.2
	001-R	1996	15.5-16.4	0.2
	003-R	1996/1997	0.6	0.2

The Army should re-sample soil and sediment at both sites. The samples should be analyzed using detection limits that are lower than the human health-based standards.

Response: Please see response to the first comment above.

Question/comment: The Army does not appear to have done the work required to determine groundwater flow directions at either site. Effective and efficient groundwater monitoring cannot be performed unless groundwater flow directions are known.

The Army should produce maps showing groundwater flow directions at each site.

Response: Hydrogeology was already addressed at sites 001-R and 003-R under the 1998 IRP ROD (see 1997 Remedial Investigation Report). Based on the Hydrogeological Assessment, the groundwater and surface flow direction at LHAAP-003-R are to the northwest and parallel to Sanders Branch and Harrison Bayou and at LHAAP-001-R groundwater flow is northerly. In addition, groundwater surface data from May 2000 (attached) for monitoring wells 127, 128 and 18WW16 at site LHAAP-003-R has been evaluated and confirms a northwest groundwater flow direction. Groundwater surface data from May 2000 for monitoring wells 27WW01, 27WW02, 27WW03, 27WW04, 131 and 132 at site LHAAP-001-R confirm a groundwater flow direction to the northeast. Maps showing groundwater flow direction at each site are attached as **Appendix B**.

Question/comment: There are six monitor wells at site 001-R, and four monitor wells at site 003-R. In addition, one-time grab samples were obtained from borings at each site.

The Army does not know whether there are a sufficient number of monitor wells at each site because it does not know whether the wells are down gradient of contaminated areas (see above comment on groundwater flow directions). The Army should evaluate the need for additional monitor wells after it has determined groundwater flow directions at each site.

Response: Please see the above response. Hydrogeology was already addressed at these sites.

Question/comment: The Army is using a groundwater standard for perchlorate of 72 µg/L. However, the EPA health reference level (HRL) for perchlorate is 15 µg/L. In addition, the EPA has decided to establish a primary drinking water standard (MCL) for perchlorate. When established, the perchlorate MCL will probably be similar to the HRL.

If the Army abandons the monitor wells based on the 72 µg/L standard, it may have to re-install monitor wells when the EPA establishes an MCL for perchlorate.

Until the EPA establishes an MCL for perchlorate, the Army should use a standard that is no greater than 15 µg/L.

Response: The Army is using the TRRP Tier 1 Groundwater Residential PCL of 17 µg/L for comparison of perchlorate in groundwater.

Question/comment: The Army has analyzed soil and water samples for two isomers of dinitrotoluene (DNT): 2,4-DNT and 2,6-DNT. These are the most common isomers in technical grade DNT. However, there are four other isomers of DNT (2,3-DNT; 2,5-DNT; 3,4-DNT; and 3,5-DNT). All of the isomers are toxic.

At the Badger Army Ammunition Plant, high concentrations of the other isomers have been found in groundwater. In some cases, concentrations of the other isomers are significantly higher than the concentrations of 2,4-DNT and 2,6-DNT.

The Army should analyze soil and water samples for all isomers of DNT, not just the 2,4-DNT and 2,6-DNT isomers.

Response: At this time, there are no Federal or State of Texas promulgated screening levels for DNT isomers, other than for 2,4-DNT and 2,6-DNT. However, as part of the CERCLA process, the statutory five-year reviews will evaluate the effectiveness of the remedy, including any changes in ARARs concerning DNT isomers, and would recommend implementation of other measures if needed.

Question/comment: The Army has developed source-receptor conceptual site models for munitions constituents and OE at LHAAP sites 001-R and 003-R. The Army should also develop source-receptor conceptual site models for metals at both sites.

Response: Please see response to the first comment above.

Question/comment: The following documents were listed as primary reference documents in the Final Proposed Plan. However, they do not appear to have been included in the Army Administrative Record.

- CAPE, 2007b, Final Engineering Evaluation/Cost Analysis Action Memorandum Revision 1, Longhorn Army Ammunition Plant, Karnack, Texas, Signed by Thomas Lederle, BRAC Division, ACSIM, United States Army, 5 December.
- Environmental Protection Systems, Inc. (EPS), 1984, Longhorn Army Ammunition Plant Contamination Survey, June.
- EODT Technology, Inc., (EODT), 2009, Final Site Specific Final Report for the MEC Removal Action at the Former Longhorn Army Ammunition Plant, LHAAP-001-R (Site 27) and LHAAP-003-R (Site 54), Karnack, Texas, September.

The Army should ensure that all documents referred to in the Proposed Plan are included in the Administrative Record. If any document has been misfiled or mislabeled in the Administrative Record, the Army should so indicate when referring to that document.

Response: The Final Engineering Evaluation/Cost Analysis Action Memorandum, signed by Thomas Lederle 5 December 2007, is located in the Administrative Record in Volume 9, Year 2008. It is listed out of date in sequence.

The other two references appear to have been overlooked and will be incorporated into the Administrative Record.

Re: Draft Final 2nd Annual Remedial Action Operation Report, LHAAP-50, Former Sump Water Tank, Longhorn Army Ammunition Plant, Karnack, Texas

Dear Mr. Mayer,

The above-referenced document is being transmitted to you for your records and includes revisions based upon your comments on the Draft. In accordance with the FFA, the Draft Final will be considered Final after 30 days without further comment.

The document was prepared by AECOM on behalf of the Army as part of AECOM's Performance Based Remediation contract for the facility. I ask that Debra Richmann, AECOM's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler

Responses to Comments on
Draft 2nd Annual Remedial Action Operation Report for Site LHAAP-50 (Former Sump Water Tank)
Longhorn Army Ammunition Plant, Karnack, Texas

September 2016

Reviewer: Richard Mayer, EPA

Respondent: Marwan Salameh and Debra Richmann, AECOM

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1		Appendix E	EPA agrees with the changes except for 50WW19, which EPA recommends continued monitoring.	D	Monitoring well 50WW19 is a fully-penetrating well similar to adjacent monitoring well 50WW17, which is approximately 60 feet away. The groundwater elevations in these wells are only slightly different (≤ 0.16 ft). This area of the site has been below the MCLs/PCLs throughout the 2-year RA(O) monitoring period. Either of these wells provides information that represents the northeastern LUC boundary of the site. Therefore, monitoring one of these wells suffices to capture groundwater characteristics.	
2		Figures	Please add monitoring wells LHSMW54 and 53 to the appropriate Figures.	E	Monitoring well LHSMW53 is not relevant to site 50 and is not discussed in the report. Therefore, LHSMW53 will not be included on the figures. LHSMW54 belongs to LHAAP-47. It is included on Figures 2-1 and 2-10. While the well has been sampled in February 2015, May 2015, and November 2015, as discussed in the report, LHSMW54 should not be sampled and will not be sampled in the future. Any discussion in relation to LHSMW54 pertains to LHAAP-47.	
3		Figure 2-6	The TCE plume should include well 50WW05.	C	Extended the TCE plume to include 50WW05.	
4		General	The following should be considered site COCs: 1,2-dichloroethane; cis-1,2-dichloroethene; vinyl chloride, 1,1-dichlroethene, since they are above the MCL.	C	All of these COCs are included in Section 1.4 (Conceptual Site Model) with the exception of 1,1-dichloroethene, which is now added.	

Responses to Comments on
Draft 2nd Annual Remedial Action Operation Report for Site LHAAP-50 (Former Sump Water Tank)
Longhorn Army Ammunition Plant, Karnack, Texas

September 2016

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
1		Figures	LHSMW53 is missing on all Figures	X	LHSMW53 is incorrectly used in Appendix E of the Year 2 report. LHSMW53 will be corrected to refer to well LHSMW54 in Appendix E. LHSMW54, which is located at LHAAP-47 was sampled during the February 2015, May 2015 and November 2015 events. A new figure (Figure 1-3) has been added that shows all wells associated with LHAAP-50 and nearby wells located at LHAAP-47.	
2		Table 2-1 and Appendix D	50WW28 is missing on Tables 2-1 and Appendix D. Should be no change.	C/X	Added 50WW28 to Table 2-1 and Appendix D in the 1st Year RA(O) report with a note to re-evaluate after one year of quarterly sampling.	
3	1-3	Sections 1.2 and 1.4	Should the groundwater now reference residential, rather than industrial maintenance worker/exposure scenario?	C	The reference to the industrial worker refers to the receptor used in the original risk assessment exposure scenario. The TRRP Residential Groundwater PCL is used in this report for perchlorate. Added cleanup level discussion in the second paragraph of Section 1.4. Also added reference to the dispute decision letter (EPA, 2014) and full citation in the references section.	
4		Figures 2-1and 2-10	Need a note for the data set. 12/15/16 Additional Comment: Figure 2-10 should be using a more current data set. By using the older data set, it really looks like 50WW28 should be retained for monitoring program. Since each figure should be able to stand alone, please replace the data set with one from a recent event to demonstrate the TCE is currently delineated by 50WW16. I think this could be a replacement page.	C C	Added a footnote on Figure 2-1 indicating that the data is from October 2013 sampling event. Data from November 2015 sampling has been added to Figure 2-10.	
5		Figure 2-11	Please replace the inset with the portion from Figure 1-2 with streets and creeks	C	Inset from Figure 1-2 was used for the inset of Figure 2-11.

1. Respondent Concurs (C), Does Not Concur (D), Takes Exception (E), or Delete (X).
2. Commentor Agrees (A) with response, or Does not Agree (D) with response.

Comment #	Page	Section/ Paragraph	Comment	C, D, E or X[1]	Response	A or D[2]
6		Sections 2.4 and 4	The narrative about GPW-1A results should include brief statement about the soil cover repairs at Site 47 with date of the work.	C	Added narrative about the soil cover repairs at LHAAP-47 to prevent impacting surface water at GPW-1A.	
7		Section 2.5	Concur with abandonment of 50WW03 and 50WW19 but 50WW20 should be retained.	C/E	Text in Section 2.5 will be revised to indicate 50WW20 will not be abandoned. It will only be eliminated from sampling at this time since the plume extent is defined by wells 50WW21, 50WW23, and 50WW24.	
8	General		I generally agree with the reduction of sample locations as proposed. Noted that 50WW17 has different recommendations in Years 1 and 2. I prefer Year 2 proposal which keeps this well for contaminant monitoring.	C	Noted that 50WW17 will be included in the sampling program. The Year 1 recommendation has been revised to match the recommendation proposed in the Year 2 report.	
9	General		At the Five-Year Review, if not earlier, the effectiveness of this remedy should be evaluated. Attenuation is minimal thus far and active treatment of the hot spots should be considered to reduce long-term monitoring commitments.	C	Acknowledged.

Subject: RE: FOR AGENCY REVIEW - LHAAP-50 Draft Final Year 2 RAO Report

Good morning. I've reviewed the Draft Final LHAAP-50 2nd Year RAO Report and RTCs. I have one comment on #4 but accept all other responses.

4 – Figure 2-10 should be using a more current data set. By using the older data set, it really looks like 50WW28 should be retained for monitoring program. Since each figure should be able to stand alone, please replace the data set with one from a recent event to demonstrate the TCE is currently delineated by 50WW16. I think this could be a replacement page.

Sincerely,

April Palmie

1 INTRODUCTION

The United States (U.S.) Army Corps of Engineers (USACE), Tulsa District, contracted AECOM Technical Services, Inc. (AECOM), to perform remedial activities at multiple sites at the former Longhorn Army Ammunition Plant (LHAAP) located in Karnack, Texas, under the Huntsville District's Worldwide Environmental Restoration Services Contract Number (No.) W912DY-09-D-0059, Task Order No. DS01. As part of this contract, AECOM is performing groundwater monitoring as part of Remedial Action Operations (RA(O)s) for the Monitored Natural Attenuation (MNA) groundwater remedy at site LHAAP-50. A Final Record of Decision (ROD) was executed for LHAAP-50 in September 2010 (USACE, September 2010). Groundwater monitoring at LHAAP-50 is ongoing as described in the Final Remedial Action Completion Report (RACR) (AECOM, 2016). This RA(O) report represents the second year of RA(O) implementation and summarizes the results of site inspections and sampling activities completed between December 2014 and November 2015. A draft first year RA(O) report which covers the period between October 2013 and November 2014 was prepared in April 2015. This report encompasses and provides analysis for two years of MNA data.

LHAAP is located in east-central Texas in the northeastern corner of Harrison County between State Highway 43 in Karnack, Texas, and the western shore of Caddo Lake (see **Figure 1-1 and Figure 2-1**). The nearest cities are Marshall, Texas, approximately 14 miles to the southwest, and Shreveport, Louisiana, approximately 40 miles to the east. Caddo Lake is a large freshwater lake that bounds the former LHAAP installation to the north and east. The eastern fence is 3.5 miles from the Texas-Louisiana state border. LHAAP-50 is slated for transfer from the Army to U. S. Fish and Wildlife Service (USFWS) for incorporation into the Caddo Lake National Wildlife Refuge in the future.

1.1 Remedial Action Objectives

The Remedial Action Objectives (RAOs) at LHAAP-50 must protect human health and meet applicable or relevant and appropriate requirements (ARARs). There are no ecological risks at the LHAAP-50 site (USACE, 2010).

As specified in the Remedial Action Work Plan (RAWP) (AECOM, 2013), the RAOs for the LHAAP-50 site, consistent with the reasonably anticipated future use as a national wildlife refuge, are:

- Protection of human health by preventing human exposure to the contaminated groundwater;
- Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water; and,
- Return of groundwater to its potential beneficial uses as drinking water, wherever practicable.

1.2 Performance Objectives

The remedy selected for LHAAP-50 includes Soil Removal, Land Use Controls (LUCs), and MNA. The performance objectives at LHAAP-50 consist of three components: excavation and off-site disposal of perchlorate-contaminated soil, physical inspections, and groundwater/surface

water monitoring. The need for additional plume delineation after the implementation of the remedial action (AECOM, 2016) delayed establishment of the LUC boundary. As a component of the LUC implementation, the civil survey of the LUC boundary was conducted in May 2015 and recorded in the Harrison County Courthouse in June 2015. Physical inspections are conducted annually to confirm compliance with the LUC objective of preventing human exposure to groundwater contamination at levels that pose an unacceptable risk to a future maintenance worker; and ensuring that there is no withdrawal or use of groundwater from the site for anything other than environmental monitoring and testing until the cleanup levels are attained. Groundwater monitoring has been in-progress at the site since October 2013, and LHAAP-50 will be included in the facility-wide LHAAP Five-Year Review.

According to the Remedial Design (Shaw, 2011), groundwater monitoring is being performed to demonstrate that natural attenuation is an effective remedy that will attain the RAOs over time and that the groundwater plume will not migrate and discharge to nearby surface water bodies at levels that may present an unacceptable risk to human health and the environment. Groundwater monitoring is being performed in accordance with the RAWP (AECOM, 2013) to:

- Detect changes in environmental conditions that may reduce the efficacy of natural attenuation processes;
- Identify potentially toxic and/or mobile transformation products;
- Verify that the plume is not expanding and poses no unacceptable risk to downgradient receptors;
- Detect new releases of contaminants to the environment that could impact effectiveness of the MNA remedy; and
- Verify attainment of the RAOs.

Groundwater monitoring completed as part of the 2014/2015 RA(O) consisted of four quarterly groundwater gauging events of 29 wells in the shallow zone and one well in the intermediate zone, and four quarterly groundwater sampling events of 26 wells in the shallow zone and one well in the intermediate zone, as specified in the RAWP (AECOM, 2013). Quarterly surface water sampling at points 50SW06 and GPW-1 located at Goose Prairie Creek and at GPW-1A located in a tributary to Goose Prairie Creek was conducted when surface water was present or after rain events exceeding 2 inches. This report summarizes the LUC compliance inspection, monitoring well inspection, maintenance, and repair, results of groundwater and surface water sampling, and an evaluation of MNA.

1.3 Site Description

The LHAAP-50 site (former sump water tank) is in the north-central portion of LHAAP and covers an area of approximately 1 acre (**Figure 1-2**). The LHAAP-50 site is an open area of grass and brush that is bounded by South Crocket Avenue to the northeast, a drainage ditch to the west, a railroad spur to the south, and Goose Prairie Creek to the north. Runoff from the northeastern portion of the site is generally toward the northeast. Runoff is collected by a drainage ditch to the northeast that runs parallel to South Crockett Avenue and eventually joins Goose Prairie Creek. Runoff from the southwestern portion of the site is collected to the west by

a drainage ditch that carries the runoff north into Goose Prairie Creek. Goose Prairie Creek eventually empties into Caddo Lake.

When operational, LHAAP-50 contained a 47,000-gallon capacity aboveground storage tank (AST) which received industrial wastewater from various industrial waste production sumps throughout LHAAP between 1955 and 1988. After the solids were filtered, the storage tank contents were discharged into Goose Prairie Creek upstream of the Goose Prairie Creek bridge on South Crockett Avenue, south of 51st Street (see **Figure 2-1**). The flow in the creek was sufficient to dilute the water to safe levels (Jacobs, 2002). If natural flow in the creek was considered insufficient, clean water was reportedly pumped into the creek to dilute the contents. The AST is no longer present.

The LUC area associated with the groundwater use restriction at LHAAP-50 extends beyond the northern, southern, eastern, and western historical site boundaries and encompasses a total of approximately 77.19 acres. The nearest significant surface water body to LHAAP-50 is Goose Prairie Creek, located approximately 80 feet north of the site, which eventually flows into Caddo Lake. LHAAP-50 has no known areas of archaeological or historical importance.

1.4 Conceptual Site Model

The nature and extent of contamination at LHAAP-50 was evaluated during field investigations conducted between 1992 and 2010. Releases associated with AST operation are the most likely source of contaminants released into the environment. Since the AST has been removed, there is no longer a potential release mechanism for leaks or spills. Perchlorate and volatile organic compounds (VOCs) were released via overland spills, and discharges to the soil and adjacent surface water.

The contaminants of concern (COCs) at the LHAAP-50 site include dissolved phase perchlorate and VOCs including tetrachloroethylene (PCE), trichloroethylene (TCE), 1,1-dichloroethylene (1,1-DCE), 1,2-dichloroethane (1,2-DCA), cis-1,2-dichloroethylene (cis-1,2-DCE), and vinyl chloride (VC) in groundwater, and perchlorate in soil. There are no COCs in other environmental media at the LHAAP-50 site. The presence of these COCs in the soil and groundwater represents the primary driver for remedial action as there are no ecological risks at the LHAAP-50 site. The soil cleanup levels are the Texas Risk Reduction Standard No. 2 Industrial Medium Specific Concentrations (MSCs). The groundwater cleanup levels are the United States Environmental Protection Agency (USEPA) Maximum Contaminant Levels (MCLs) and in the absence of a federal drinking water standards, the Texas Risk Reduction Program Groundwater Residential Protective Concentration Levels (PCLs) (USEPA, 2014).

The area of perchlorate contamination in soil was small and the concentrations of perchlorate did not pose an unacceptable risk to human health (hypothetical future maintenance worker) or ecological receptors. The perchlorate in soil is no longer present after removal and offsite disposal of approximately 183 cubic yards of perchlorate-contaminated soil in September 2013 as described in the Final RACR (AECOM, 2016). An area of groundwater contamination is observed in the shallow groundwater (upper and lower zones) which poses an unacceptable carcinogenic risk and non-carcinogenic hazard to a future maintenance worker under an industrial exposure scenario. There is no groundwater contamination in the intermediate groundwater zone. The potential exposure pathways are via use of groundwater as drinking water and migration of impacted groundwater into surface water. Shallow groundwater is not

used as drinking water at the refuge and this potential exposure pathway is eliminated from any hypothetical receptor because LUCs are in place that prohibit the use of groundwater other than for environmental monitoring and testing. The nearest significant surface water body to LHAAP-50 site is Goose Prairie Creek, approximately 80 feet to the north of the site.

In previous documents, the site hydrogeology was represented as consisting of a shallow zone (approximately 0-30 feet below ground surface [bgs]) and an intermediate zone (approximately 35 to 60 feet bgs). Drilling activities performed during implementation of the remedial action (AECOM, 2016) revealed only a shallow unconfined aquifer extending from ground surface to approximately 60 feet bgs across the site. While intermittent clay layers are present, no true aquiclude exists to prevent vertical communication between ground surface and approximately 60 feet bgs.

The intermediate groundwater zone was identified at 100 feet bgs, underlying a dry unit of clay with some interbedded sands. The clay unit is first encountered across the site at approximately 60 feet bgs.

Because the shallow zone is approximately 60 feet in thickness, the potential for differences in nature and extent of contaminant impacts between upper and lower portions of the shallow zone was recognized. To evaluate this concept, 17 new wells were installed in configurations to separately monitor the upper portion of the shallow zone (12 wells) and the lower portion of the shallow zone (five wells). Additionally, three fully-penetrating wells (50WW17, 50WW19, and 50WW20) were installed with screened intervals across the entire saturated shallow zone. Monitoring well locations are shown on Figure 1-3.

Beginning with the 1st year RA(O) report and in all future reports including this 2nd year RA(O) report, the zone formerly referred to as the shallow zone is referred to as the ‘upper shallow’ zone (0 to 30 feet bgs), the zone formerly referred to as the intermediate zone is referred to as the ‘lower shallow’ zone (30 to 60 feet bgs). The zone formerly referred to as the deep zone is referred to as the intermediate zone (>100 feet bgs).

Based on the groundwater gauging data conducted in October 2013 and reported in the Final RACR (AECOM, 2016), groundwater in the shallow water-bearing zone ranges from approximately 15.97 feet bgs to 24.03 feet bgs, flowing in a northeasterly direction at a gradient of approximately 0.001 ft/ft.

The intermediate water-bearing zone (intermediate zone) underlies the shallow zone at approximately 100 feet bgs. The groundwater surface within the intermediate water-bearing zone was found to be 21.07 feet bgs, indicating confining conditions.

2 SITE ACTIVITIES AT LHAAP-50

2.1 Annual LUC Compliance Inspections, Monitoring, and Repairs

2.1.1 Annual LUC Compliance Inspection

The objectives of the LUCs at LHAAP-50 are to prevent human exposure to groundwater contamination presenting an unacceptable risk to human health and ensure that there is no withdrawal or use of groundwater beneath the site for anything other than environmental monitoring and testing until the cleanup levels are attained. A restriction against use of groundwater will remain in effect until the levels of COCs in groundwater and soil allow unrestricted use and unlimited exposure (UU/UE). Notices of the groundwater use restrictions accompany all property transfer documents and were recorded at the Harrison County Courthouse in June 2015 in accordance with the Texas Administrative Code (TAC) Title 30, §335.566.

The LUCs address the area of the LHAAP-50 site that contains shallow zone groundwater VOC and perchlorate contamination.

A metes and bounds survey of the 77.19-acre LUC boundary has been completed and has been recorded in the Harrison County Courthouse in accordance with TAC Title 30, §335.566. Additionally, the survey plat, legal boundary, and description of the groundwater restriction, in conjunction with a locator map, were provided to the Texas Department of Licensing and Regulation in June 2015.

The need for additional plume delineation after the implementation of the remedial action (AECOM, 2016) delayed establishment of the LUC boundary. A LUC compliance inspection was not conducted in 2014 as the LUC boundary had not been established at the end of the 1st year RA(O) reporting period. A LUC compliance inspection was conducted on July 14, 2015 during the 2nd RA(O) reporting period. No change in land use has occurred. The Annual LUC Compliance Certification Documentation Form for the second year RA(O) period is included in **Appendix A**. No compliance issues or concerns were noted during the annual inspection.

2.1.2 Well Field Operation & Maintenance

Inspections of the conditions/integrity of monitoring wells are conducted during each sampling event and the information recorded on the field sampling forms. Maintenance or repairs are performed as needed, based on observed conditions. For the 2nd annual reporting period, no damage to well bollards, pads, or protective well casings and only minimal encroachment of weeds or brush on the well pads was observed. Mowing the area to control brush and weeds is conducted on a routine basis and as needed to allow access to the wells, typically before sampling events. Mowing is conducted more frequently during the warmer spring and summer months than during the colder fall and winter seasons. Monitoring well identification tag replacement, as well as painting/re-labeling for wells 50WW01, 50WW03, and 50WW04 was completed on August 28, 2015 and for wells 50WW02, 50WW05, and 50WW06 on September 2, 2015. Well redevelopment for wells 50WW05 and 50WW19 to remove silt accumulation was completed on January 22 and 26, 2016. **Appendix B** provides a photo log and well redevelopment forms.

2.2 Installation of New Permanent Groundwater Monitoring Wells

A total of twenty-one new monitoring wells were installed in 2013 and 2014, and identified as 50WW08 through 50WW28. Twelve (12) wells were screened in the upper portion of the shallow groundwater zone, five (5) wells were screened in the lower portion of the shallow groundwater zone, and three wells were installed with screened intervals spanning the entire shallow groundwater zone (fully-penetrating wells). One (1) new well was installed in the intermediate groundwater zone. Monitoring well boring logs and construction logs were included in the LHAAP-50 Final RACR (AECOM, 2016).

2.3 Groundwater Monitoring

For the 2nd year RA(O), quarterly groundwater gauging of 30 monitoring wells and sampling of up to 27 wells were completed in February 2015, May 2015, August 2015, and November 2015. Monitoring wells 47WW38 and LHSMW54 were sampled in February 2015, May 2015, and November 2015 (as discussed later these wells should not be sampled). Although monitoring well 50WW25 is physically located within the LHAAP-50 LUC boundary, the source of perchlorate in this well is at LHAAP-47. Monitoring wells 50WW02, 50WW03 and 50WW04 (upper shallow monitoring wells) continued to be dry during the 2nd year RA(O) sampling events, thus groundwater samples could not be collected from these wells. These wells are located up gradient of the impacted zone and are primarily replaced by data from wells 50WW08, 50WW22, and 50WW21, respectively. Therefore, there were no limitations on data available for use in the MNA evaluation or analysis of plume stability, noting that monitoring well 50WW02 had reported historical concentrations of 110 μg/L for perchlorate and 8,050 μg/L for trichloroethene on April 03, 2009, which are above the cleanup levels.

The monitoring wells are depicted in **Figure 2-1** and listed in **Table 2-1**. Each of the 30 wells was secure and sampled with no major technical issues encountered as depicted in **Table 2-2**.

Before collecting groundwater samples, the wells were gauged using a water level probe and the depth to water was recorded to the nearest 0.01 foot from the top of casing. Water samples were collected using the low-flow sampling technique as described in the groundwater sampling procedures found in the Installation-Wide Work Plan (AECOM, 2014). The objective of using this method was to collect representative samples of the groundwater in the formation adjacent to the well screen, eliminating the mixing of stagnant water above and below the well screen. After water quality parameters stabilized and were within acceptable ranges per the Work Plan, samples were collected at the same low flow rate.

Groundwater sampling forms are presented in **Appendix C**. Chain of custody forms, laboratory reports and data validation reports are presented in **Appendix D**.

2.3.1 Groundwater Elevations and Flow Direction

Shallow groundwater at LHAAP-50 in May 2015 was interpreted to flow in an easterly and northeasterly direction but was primarily interpreted to be northeasterly in February 2015, August 2015, and November 2015 (see **Figures 2-2 through 2-5**). In Figures 2-2 through 2-5, monitoring wells screened in the upper shallow zone or are fully-penetrating were used and wells that are screened in the lower shallow zone (50WW06, 50WW09, 50WW14, 50WW26, and

50WW27) were not used. Groundwater elevation data for 8 RA(O) quarters is shown in **Table 2-1.**

Groundwater elevations generally increased across the site between February 2015 and May 2015, with a range between 1.10 feet and 2.94 feet, averaging an increase of 1.58 feet. Subsequently groundwater elevations decreased between 1.99 and 3.39 feet with an average of approximately 2.60 feet between May 2015 and November 2015 across the site. The May 2015 groundwater elevations were the highest they have been over the entire 2-year RA(O) monitoring period. The high water table in May 2015 could have been the cause of the observed change in groundwater flow direction from mostly northeasterly to easterly/northeasterly. This change in groundwater flow direction observed in May 2015 was short-lived and returned to mostly northeasterly in August 2015.

2.3.2 Groundwater Analytical Results

Analytical results for the quarterly samples are presented in **Table 2-3** and mapped on **Figures 2-6** through **2-9**.

All wells were sampled for VOCs and perchlorate during all sampling events of the 2nd year RA(O), with the following exceptions:

- Wells 50WW02, 50WW03, and 50WW04 were dry during all sampling events;
- 47WW38 and LHSMW54 were not sampled during the August 2015 sampling event. Sampling 47WW38 and LHSMW54 will be discontinued for the LHAAP-50 RA(O) monitoring program, because these wells are not associated with an LHAAP-50 plume. These wells will not be discussed further.

Perchlorate, TCE, PCE, 1,1-DCE, 1,2-DCA, cis-1,2-DCE, and VC are the COCs detected above their respective cleanup levels in the 2nd year RA(O) sampling. Because monitoring wells 50WW25 and 47WW38 represent a separately-sourced perchlorate plume from LHAAP-47, the results from these wells will not be discussed further.

During the February 2015 sampling event, wells 50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, 50WW16, 50WW18 50WW20, 50WW21, 50WW22, 50WW27, and 50WW28 had concentrations above laboratory detection limits for select COCs. Multiple wells (50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, and 50WW15) had concentrations exceeding COC MCLs and/or the Texas Risk Reduction Program (TRRP) Residential Groundwater Protective Concentration Level (PCL) for perchlorate.

During the May 2015 sampling event, wells 50WW01, 50WW05, 50WW06, 50WW07, 50WW08, 50WW09, 50WW10, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, 50WW19, 50WW21, 50WW22, 50WW23 50WW24, 50WW27, and 50WW28 had concentrations above laboratory detection limits for select COCs. Multiple wells (50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, and 50WW23) had concentrations exceeding COC MCLs/PCL.

During the August 2015 sampling event, wells 50WW01, 50WW05, 50WW06, 50WW08, 50WW09, 50WW10, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, 50WW16, 50WW17, 50WW18, 50WW21, 50WW22, 50WW23, 50WW27, and 50WW28 had

concentrations above laboratory detection limits for select COCs. Multiple wells (50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, and 50WW15) had concentrations exceeding COC MCLs/PCL.

During the November 2015 sampling event, wells 50WW05, 50WW06, 50WW08, 50WW09, 50WW10, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, 50WW16, 50WW21, 50WW22, 50WW27, and 50WW28 had concentrations above laboratory detection limits for select COCs. Multiple wells (50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, and 50WW15) had concentrations exceeding COC MCLs/PCL.

Laboratory analytical results are included in **Appendix D**, and are discussed further in **Section 3**. Historical groundwater analytical results are presented in **Table 2-4**.

2.3.3 Groundwater Sampling Optimization

The results of the 1st year of remedial action groundwater analytical data showed smaller plumes than those presented in the RAWP (AECOM, 2013). As a result, modifications to the list of wells being monitored for MNA parameters and contaminants were proposed in the 1st year RA(O) Report. The 1st year data was corroborated by the analytical results during the 2nd year RA(O) monitoring period. **Appendix E** provides a listing of the monitoring wells associated with the LHAAP-50 MNA groundwater monitoring program and changes to subsequent monitoring events as proposed in the 1st year RA(O) report. Upon further inspection, the 2nd year RA(O) data confirmed these recommendations, which will be applied to subsequent MNA monitoring events. Additional changes may be made for future events, as data from each new sampling event is evaluated.

Two types of changes to the MNA groundwater monitoring program were proposed in the 1st year RA(O) Report: changes to MNA parameter monitoring and changes to contaminant monitoring. With respect to changes in MNA parameter monitoring, the objective is to retain wells representing different contaminant conditions within the aquifer, while eliminating duplications. At this time, monitoring of MNA parameters will continue in at least one well for each combination of contaminants (i.e., high VOC/high perchlorate, moderate VOC/moderate perchlorate, low VOC/low perchlorate, low VOC/high perchlorate, high VOC/low perchlorate, and clean background), and representation of both lower and upper portions of the shallow groundwater zone will be maintained. For changes in contaminant monitoring, wells outside the plume that do not contribute to plume delineation will be eliminated from the sampling program.

To summarize the recommendations presented in **Appendix E,** the 1st year RA(O) monitoring data, which has been corroborated by the 2nd year RA(O) data, indicate that MNA parameter monitoring at 50WW18 and 50WW24 can be discontinued without compromising MNA data because these wells are outside the contaminant plumes. Additionally, 50WW16 should be added to the list of wells for MNA parameter monitoring. Contaminant data indicates contaminant monitoring can be discontinued at 50WW19, while continuing to monitor well 50WW17 located in close proximity of 50WW19. Additionally, wells 50WW07, 50WW20 and 50WW26 do not contribute to plume delineation (i.e., an unimpacted well exists between the named well and the plume) and can be eliminated from sampling. Well 50WW28 does not contribute to plume delineation (i.e., an unimpacted well exists between the named well and the plume) but was retained for re-evaluation after four additional quarters of sampling. Because 2nd year RA(O) quarterly results for 50WW28 and upgradient well 50WW16 were consistently

below the MCLs/PCL or below detection, 50WW28 will be eliminated from future sampling. LHAAP-47 wells 47WW38 and LHSMW54, initially included in the monitoring network to assess potential contribution of contaminants from LHAAP-47 sources, do not contribute to delineation of LHAAP-50 plumes and can be eliminated from sampling. Finally, monitoring wells 50WW03 and 50WW04 are replaced by 50WW22 and 50WW21, wells that are closer to the plume. Therefore, these wells will no longer be included in the RA(O) sampling program. A summary of the new monitoring program should it be approved is presented in **Exhibit 2-1** below and in **Figure 2-10**.

Exhibit 2-1: Proposed Monitoring Program – LHAAP-50

DP - TCE biodegradation daughter products
J - estimated concentration
LOC - location of well relative to source/plume (UG-upgradient, DG-downgradient, SG-sidegradient, CP indicates wells at center of the plume, P indicates the well is within the plume)
MNA - Monitored Natural Attenuation parameters
ND - not detected
P - Perchlorate
VOC - volatile organic compounds
* As of November 2015 sampling event in micrograms per liter (µg/L)

2.4 Surface Water Sampling

Two years of quarterly surface water monitoring at Goose Prairie Creek monitoring point GPW-1 adjacent to the LHAAP-50 site is prescribed in the RAWP (AECOM, 2013) following excavation of perchlorate-contaminated surface soils to evaluate the effectiveness of the removal action. Additional surface water samples are to be collected from monitoring point GPW-1A to assess potential contaminant contributions to GPW-1 from the perchlorate-contaminated surface soil area at LHAAP-47. Finally, Goose Prairie Creek location 50SW06 will be sampled to assess the success of the groundwater remedial action in preventing impacts to surface water through migration of groundwater COCs to the surface water body. **Figure 2-11** depicts the surface water sampling locations. Surface water sampling data are included in **Table 2-3**. Quarterly surface water samples were collected from 50SW06 and GPW-1 in February 2015, May 2015, and November of 2015. These two sampling points were dry during the August 2015 sampling event. Surface water samples were collected from GPW-1A in February 2015 and May of 2015; however, it was dry during the August and November 2015 sampling events. In October 2015 and December 2015, limited soil cover repair activities were completed in an area of perchlorate-contaminated surface soils at LHAAP-47, where erosion of the soil cover and exposure of the plastic liner were observed. The repair included placement of a new plastic liner and 6 inches of clean topsoil. The topsoil was seeded with rye grass and covered with erosion matting. The repair was conducted to prevent potentially exposed perchlorate-contaminated soil from impacting surface water in a ditch contributing to Goose Prairie Creek.

Additional surface water samples were collected during rainfall events on February 23, 2015, May 08, 2015, and October 26, 2015. An additional sampling event was conducted on November 19, 2015 at the end of a rainfall event, but while runoff was still occurring. The amount of rainfall that occurred on the day of sampling and 48 hours before each sampling event is presented in **Exhibit 2-2**. The surface water sample collection forms as depicted in Appendix J of the Final RACR (AECOM, 2016) are presented for locations GPW-1 and GPW-1A in **Appendix F**. Some deviations from the sampling protocol occurred on certain occasions (e.g., the time of start of rain to the time a sample is collected and observations of surface runoff were not recorded, and photographs of ground surface and creek conditions were not taken), such as for October 26, 2015 sampling event when heavy rainfall and the highest rainfall amounts recorded occurred over the weekend, or when rain started sometime overnight. In such situations, determining the exact time rain began falling was not possible.

Exhibit 2-2: Summary of Conditions at Time of Surface Water Sampling

Date of Sampling	Sampling Objective	Rain		Concentration (µg/L)	
		Day of Sampling	48 Hours before Sampling	GPW-1	GPW-1A
02/17/15	Quarterly	0.0	1.29	0.737	38.2
02/23/15	RACR Requirement	1.24	0.0	0.311 J	Dry
05/08/15	RACR Requirement	3.00	0.0	0.156 J	16
05/22/15	Quarterly	0.0	1.63	0.213 J	Dry
08/19/15	Quarterly	1.21	0.0	Dry	Dry
10/26/2015	RACR Requirement	0.35	4.98	0.684	Dry
11/13/15	Quarterly	0.0	0.0	0.139 J	Dry
11/19/15	RACR Requirement	0.0	3.31	0.142 J	Dry

J – Concentration is estimated by the analytical laboratory analyst
GWP-1 collected from Goose Prairie Creek
GPW-1A collected from a tributary of Goose Prairie Creek upstream of GPW-1

Perchlorate was detected in all GPW-1 samples, but all concentrations were below the PCL of 17 µg/L. The concentrations of perchlorate varied within a narrow range and were consistently below 1 µg/L in GPW-1. The concentrations of perchlorate in the samples collected from the LHAAP-47 tributary of Goose Prairie Creek were 50 to 100 times greater than the reported concentrations in GPW-1 and contribute to the perchlorate detection in Goose Prairie Creek. The lowest concentration in Goose Prairie Creek was reported when no rainfall occurred in the preceding 48 hours (November 13, 2015 sample at GPW-1).

Correlations between perchlorate concentrations in Goose Prairie Creek and rainfall amounts on the day of sampling, 48 hours before sampling day, and in aggregate are 27%, 45%, and 32%, respectively. This indicates that the occurrence of rain on the day of sampling actually reduces perchlorate concentration in Goose Prairie Creek, while the occurrence of rain 48 hours prior to the day of sampling increases the perchlorate concentration in Goose Prairie Creek, presumably because time is needed for the contamination to migrate from the tributary of Goose Prairie Creek to Goose Prairie Creek.

Because the groundwater elevation has consistently been below the bottom of the surface water sampling locations at locations 50SW06 and GPW-1, the methodology to sample surface water when the groundwater elevation is higher than surface water as depicted in Appendix J of the Final RACR (AECOM, 2016) was not applied. **Exhibit 2-3** summarizes the groundwater elevations for the closest upgradient monitoring wells to surface water sampling locations 50SW06 and GWP-1 along Goose Prairie Creek, compared to the elevation of the bottom of the creek/ditch at those surface water sampling locations. Analytical results for the samples collected from 50SW06, GPW-1, and GPW-1A were below MCLs/PCL for all COCs except perchlorate. One perchlorate concentration of 38.2 µg/L, which exceeds the perchlorate PCL of 17 µg/L, was reported in the sample from GPW-1A collected on February 17, 2015.

Exhibit 2-3: Groundwater Elevation vs. Bottom of Drainage Channel Elevation

Surface Water Sample Location	Bottom of Drainage Channel (ft amsl)	Nearest Upgradient Well	Groundwater Elevation during Surface Water Sampling (ft amsl)	Groundwater Elevation Measurement Date
50SW06	182.902	50WW16	177.53	2/17/15
			179.28	5/22/15
			176.22	11/13/15
GPW-1	185.250	50WW01	178.15	2/17/15
			179.94	5/8/15
			179.94	5/22/15
			177.05	11/13/15

Ft amsl – feet above mean sea level
No upgradient well is identified for surface water sampling location GWP-1A located at LHAAP-47.

2.5 Well Abandonment

The RAWP (AECOM, 2013) states that recommendations for well abandonment would be made in the MNA Performance Evaluation Report. After 8 quarters of MNA sampling, wells 50WW03, and 50WW19 are recommended for abandonment. This recommendation is based on the analysis completed in **Appendix E** and **Section 2.3.3**.

* These wells are excluded from the sampling program for LHAAP-50 . Contamination in these wells is from another source.
SOP - standard operating procedure (AECOM, June 2013).

	Normal Range	Acceptable Variability
pH	4.6 to 8.5	±0.1
Temp (^{o}C)	10 to 18	±10%
Specific Conductivity (uS/cm)	10 to 8,000	±3%
Oxidation Reduction Potential (mV)	+400 to -300	±10%
Dissolved Oxygen (mg/L)	< 10	±10%
Turbidity (NTU)	variable	±10%

^{o}C - degree centigrade
uS/cm microseimens per centimeter
mV - millivolt
mg/L - milligram per liter
NTU - nephlometric turbidity unit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

[1] Only limited data validation possible; Not used in plume delineation

[2] Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Table 2-3: Groundwater Results for Year 1 and 2 - LHAAP-50

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates concentrations above the MCL/MSC/PCL

Wells 50WW02, 50WW03 and 50WW04 were dry. No samples collected.

Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter, "FF" indicate sample filtered in the field with 0.45 micron filter. Metals results for "FF" samples are dissolved.

"FD" or "D" in Sample ID indicates a field duplicate sample.

(1) Only limited data validation possible; Not used in plume delineation

(2) Substituted for 50WW08 and 50WW13 October 2013 data for plume delineation

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Limit

mg/L - milligrams per liter

MSC - Medium-Specific Concentrations

NA - not analyzed

NR – not reportable due to sample being taken from bailer

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

ug/L - micrograms per liter

UJ - The analysis was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample. 'UJ' not detects are not definite; the analyte may be present.

UTL - Upper Tolerance Limit

Blue Highlighting Indicates Analyte Detected Above MCL/MSC/PCL

(1) Only limited data validation possible; Not used in plume delineation

J - Estimated value; analyte concentration was less than the limit of quantification

MCL - maximum contaminant level

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations

NA - not analyzed

PCL - Texas Residential Groundwater protective concentration level

U - Analyte was not detected.

µg/L - microgram per liter

3 NATURAL ATTENUATION EVALUTION

The following sections present the results of the natural attenuation evaluation in accordance with the three lines of evidence discussed in the RAWP (AECOM, 2013) for LHAAP-50 groundwater COCs. The discussion below pertains only to the shallow aquifer where COCs are detected above cleanup levels.

3.1 First Line of Evidence: Change in COC Concentrations over Time and with Distance

Natural attenuation is the combination of multiple mechanisms, including biodegradation, volatilization, dilution, advection, and absorption that reduce contaminant concentrations. The decrease of COC concentrations over time and distance in the absence of any other treatment is evidence of natural attenuation. The change in groundwater COC concentrations over time and with distance was evaluated at LHAAP-50. COC concentrations in select wells for the period are identified on **Figure 3-1**.

Twenty-eight (28) monitoring wells are included in the monitoring program for collection and analysis of VOCs and perchlorate, as identified on **Table 3-1**. Sixteen (16) of the selected wells are located in the upper portion of the shallow zone, eight in the lower portion of the shallow zone, three fully-screened across the shallow zone, and one in the intermediate zone. These wells have been selected in the Final RACR (AECOM, 2016) for their placement relative to VOC and perchlorate plumes to monitor effectiveness of natural attenuation at the LHAAP-50 site.

Of all the wells included in the monitoring program, the only wells that had COCs above cleanup levels are 50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, 50WW15, and 50WW23. COCs were detected above their respective cleanup levels for 50WW25, 47WW38 and LHSMW54; however, these COCs are associated with a source from LHAAP-47 and are not part of LHAAP-50 monitoring program. The other wells in the monitoring program did not contain COCs above the cleanup levels in the four 2nd year RA(O) sampling events. The same observations were made during the 1st year RA(O) with the exception of TCE detections above the MCL of 5 µg/L in monitoring well 50WW16 in 3 sampling events and perchlorate detection above the PCL of 17 µg/L in 50WW24 in one sampling event (**Table 2-4**).

The presence of TCE daughter compounds cis-1,2-DCE and VC in 50WW05, 50WW08, 50WW09, 50WW11, 50WW13, 50WW14, and 50WW15 indicate that reductive dechlorination is occurring within the shallow zone plume.

The Final RACR for LHAAP-50 indicates that monitoring wells 50WW06, 50WW08, 50WW11 and 50WW12 would be the primary focus of perchlorate analysis at the site because they historically showed the highest perchlorate concentrations. Since the October 2013 monitoring event, 50WW13 has had increasing concentrations of perchlorate, and therefore is also discussed herein. Additionally, the Final RACR states that monitoring wells 50WW08, 50WW11, 50WW13 and 50WW14 were expected to be the primary focus of VOC analysis at the site because they historically showed the highest VOC concentrations. During the 2014-2015

monitoring period, 50WW05 also had significant concentrations of VOCs, and is therefore included in the discussion below.

Mann-Kendall statistical trend analysis for the data collected during the 2-year RA(O) period was completed for various COCs for monitoring wells 50WW05, 50WW06, 50WW08, 50WW11, 50WW12, 50WW13, and 50WW14. The trend analysis results are presented in **Appendix G** in graphical format with statistical results presented on the right hand side. The U.S. EPA's ProUCL version 5.0 was used for this analysis. The dates on the x-axis of each graph in **Appendix G** are displayed in numerical format rather than in a date format as required by the program. The concentrations of COCs are presented on the y-axis in µg/L. Half of the detection limit was used for non-detect results, where applicable. The average concentration of the sample and its duplicate was used when field duplicate samples were collected. The level of significance was 5%. A summary table of the Mann-Kendall results is presented below in **Exhibit 3-1**.

Well 50WW05

Dating back to 2002, a total of 13 data sets are available for this well (**Table 2-4**). Perchlorate was detected at levels of 5,850 micrograms per liter (µg/L) in 2002, 719 µg/L in 2005, 27.8 µg/L in 2007, and 20.5 in 2014. However, since then, perchlorate has remained below the cleanup level (PCL) of 17 µg/L. Also in 2005, several VOCs were detected above their MCLs including PCE, TCE, 1,1-DCE, 1,2-DCA, and VC. The concentrations of these VOCs have decreased over time, and only TCE has been detected above the MCL during the 2-year RA(O) period. TCE concentrations during the 2nd year RA(O) period were between 193 µg/L and 210 µg/L. The TCE concentrations are slightly lower than the 1st year RA(O) monitoring period, which ranged from 204 µg/L to 329 µg/L. The current TCE levels are approximately an order of magnitude lower than those detected in 2005 (3,130 µg/L) and 2007 (1,460 µg/L). Earlier data also show that PCE, 1,1-DCE, 1,2-DCA, and VC exceeded their respective MCLs until 2010 and have since remained below the MCLs. The decreasing trends in this well are a line of evidence supporting MNA. The presence of PCE/TCE daughter products such as cis-1,2-DCE and VC (in the historical data set) indicates that reductive dechlorination is taking place.

The Mann-Kendall trend analysis for 50WW05 was conducted for TCE during the past two years. The results indicate no significant trend in concentrations for TCE over the 2-year RA(O) period but with a general trend line pointing downward.

Well 50WW06

Dating back to 2004, a total of 12 data sets are available for this well (**Table 2-4**). Perchlorate and TCE are the only COCs detected in this well above their respective PCL/MCL. Perchlorate was initially detected above the PCL at 24.8 µg/L in 2005. There was a gradual increase to 2,090 µg/L in March 2014 and to 5,860 µg/L in November 2015. The TCE concentration in this well was 15 µg/L in 2004 and remained below the MCL until 2013. TCE concentrations increased during the 2-year RA(O) period from a low of 20.9 µg/L in October 2013 to a high of 59.4 µg/L in November 2015.

The Mann-Kendall trend analysis for 50WW06 was conducted for perchlorate and TCE during the past two years. The results indicate statistically-significant evidence of an increasing trend for perchlorate and no significant trend in TCE concentrations but with a trend line pointing upward. These results indicate migration of COCs into this well.

Well 50WW08

Eight data sets are available for this well. Perchlorate, cis-1,2-DCE, and TCE were detected in this well above their respective PCL/MCLs during one or more sampling events. 1,2-DCA was also detected above the MCL during the March 2014 sampling event at a concentration of 5.73 µg/L but has been below the MCL since then. In the previous monitoring period (1st RA(O)) perchlorate decreased from 6,404 µg/L in October 2013 to 56.3 µg/L in November 2014. The high perchlorate concentration in October 2013 is likely suspect as a complete data validation set was not made available and the reported concentration could not be verified. Perchlorate concentrations initially increased during this sampling period to 200 µg/L in May 2015 before decreasing to 32.4 J µg/L in November 2015. The cis-1,2-DCE concentrations initially increased during this monitoring period to 70.5 µg/L in February 2015 then decreased to 17.7 µg/L in November 2015. The presence of cis-1,2-DCE indicates the occurrence of reductive dechlorination of TCE. TCE concentrations have, on average, fluctuated during the previous monitoring period (1st RA(O)). After increasing in concentration to 852 µg/L in February 2015, TCE concentrations decreased to 288 µg/L in November 2015. 50WW08 was installed in August 2013; therefore historical data is not available.

The Mann-Kendall trend analysis for 50WW08 was conducted for perchlorate, TCE, and cis-1,2-DCE during the past two years. The results indicate no significant trend in concentrations for these COCs but the trend lines are pointing downward.

Well 50WW11

Eight data sets are available for this well. Perchlorate, TCE, 1,1-DCE, and 1,2-DCA were detected above their respective PCL/MCLs during the 2015 monitoring period. All seven COCs were detected above their respective PCL/MCLs during the 1st year RA(O) monitoring period. Perchlorate concentrations initially decreased to 2,690 µg/L in February 2015 from 22,300 µg/L detected in November 2014. Perchlorate concentrations decreased further to 1,140 µg/L in May 2015 before increasing to 22,800 µg/L in November 2015. The perchlorate concentrations in the prior monitoring period (1st year RA(O)) exhibited a similar decreasing and then increasing trend. Similar to the perchlorate TCE concentrations initially decreased from the previous sampling event of November 2014 from 3,550 µg/L to 512 µg/L in February 2015 and further to 230 µg/L in May 2015, before increasing to 2,670 µg/L in November 2015. In the previous monitoring period (1st year RA(O) period), TCE decreased from 2,750 µg/L in October 2013 to 362 µg/L in March 2014 then increased to 3,550 µg/L in November 2014. Based on the perchlorate and TCE concentrations over the course of the 2-year RA(O) monitoring period, it appears that the increase and decrease of these two constituents over time is seasonal; however, additional monitoring is required to confirm this. 1,1-DCE and 1,2-DCA were detected above their MCLs in August 2015 and November 2015. The concentrations of 1,1-DCE and 1,2-DCA increased from below their respective MCLs in February 2015 and May 2015 to 17.5 µg/L and 22.9 µg/L, respectively, in November 2015. The compounds cis-1,2-DCE, PCE, and VC were not detected above their respective MCLs during the 2nd year RA(O) period. However, these COCs were reported above their MCLs in November 2014. 50WW11 was installed in August 2013; therefore historical analytical data is not available.

The Mann-Kendall trend analysis for 50WW11 was conducted for perchlorate, TCE, and 1,1-DCE during the past two years. The results indicate no significant trend in concentrations for

these COCs over the 2-year RA(O) period with the trend lines either pointing slightly upward or slightly downward.

Well 50WW12

Eight data sets are available for this well. Perchlorate and TCE were detected above the PCL/MCL in this well during the 2015 monitoring period. Previously, only perchlorate was detected above its PCL. The concentrations of perchlorate fluctuated during this monitoring period between a low of 17,300 µg/L in August 2015 to a high of 59,200 µg/L in May 2015. A similar fluctuation of perchlorate concentrations was also observed during the 1st year RA(O) period. TCE was detected for the first time above its MCL in May 2015 at a concentration of 33.9 µg/L before decreasing to a concentration of 5.59 µg/L in August 2015 and 17.6 µg/L in November 2015. 50WW12 was installed in August 2013; therefore historical data is not available.

The Mann-Kendall trend analysis for 50WW12 was conducted for perchlorate and TCE during the past two years. The results indicate no significant evidence of trend in concentrations for perchlorate with the trend lines pointing upward. The TCE results indicate statistically-significant evidence of an increasing trend during the 2-year RA(O) period. These results indicate migration of COCs into this well.

Well 50WW13

Eight data sets are available for this well. All COCs were detected in this well above their respective PCL/MCLs during at least one 2015 sampling event. Perchlorate concentrations decreased from 11,700 µg/L in November 2014 to 648 µg/L in February 2015 and 126 µg/L in May 2015 before increasing to 11,400 µg/L in November 2015. Similar to perchlorate, TCE concentrations in this well experienced a decrease from a concentration of 9,150 µg/L in November 2014 to 1,080 µg/L in February 2015 and 433 in May 2015 before increasing to 7,710 J µg/L in November 2015. The 1st year RA(O) period exhibited a similar decrease then increase in TCE concentrations. Based on the review of this data over two monitoring periods it appears that the increase and decrease of these two COCs may be seasonal (inverse correlation between groundwater elevation and COC concentrations was discerned for all COCs over a two year period and the correlation coefficient varied between -16% for vinyl chloride and -78% for 1,2-dichloroethane). 1,2-DCA and cis-1,2-DCE also exhibited a decrease and subsequent increase in concentrations during the two RA(O) monitoring periods. The concentrations for these two COCs ended the 2nd year RA(O) monitoring period (November 2015) above their MCLs at 43.4 J µg/L and 231 µg/L, respectively. PCE, 1,1-DCE and VC concentrations also exhibited a decrease and subsequent increase in concentrations during both RA(O) monitoring periods. The reporting limits for PCE, 1,1-DCE, and VC for the November 2015 sampling event were higher than the MCLs for these constituents so the results could not be compared to the MCLs. 50WW13 was installed in August 2013; therefore historical data is not available.

The Mann-Kendall trend analysis for 50WW13 was conducted for perchlorate, TCE, cis-1,2-DCE, and 1,2-DCA during the past two years. The results indicate no significant trend in concentrations for perchlorate, TCE, cis-1,2-DCE, and 1,2-DCA over the 2-year RA(O) period with the trend lines pointing upward.

Well 50WW14

Eight data sets are available for this well. Only TCE has been detected above the MCL in this well, with concentrations decreasing from 9.14 µg/L in February 2015 to 5.78 µg/L in November 2015. This decreasing trend is a continuation of what was observed in the 1st year RA(O) monitoring period, with concentrations decreasing from 93.8 µg/L in October 2013 to 26.7 µg/L in November 2014. Simultaneously, the concentration of cis-1,2-DCE appears to be increasing in this well from 6.52 µg/L in October 2013 to 14.2 µg/L in November 2015, indicating the potential occurrence of biodegradation in this well (a -29% correlation was observed between these two COCs during the 2-year RA(O) period). 50WW14 was installed in August 2013; therefore historical data is not available. The Mann-Kendall trend analysis in 50WW14 was conducted for TCE during the past two years. The results indicate a statistically significant evidence of a decreasing trend in concentrations.

Exhibit 3-1: Mann-Kendall Trend Summary

Monitoring Well	Perchlorate	TCE	cis-1,2-DCE	1,1-DCE	1,2-DCA

-- indicates no trend analysis was completed for the parameter because the concentrations are non-detect or below the cleanup standard

3.1.1 Plume Stability

COC plume maps completed for each sampling event in the shallow zone are presented in **Figures 2-6** through **2-9**. TCE and perchlorate are the most widespread COCs in the shallow groundwater. The COC data over the 2nd year RA(O) monitoring period indicate that the plumes are showing overall stable conditions with the exception of TCE, which expanded slightly in 2015 towards 50WW12. The calculated groundwater velocity in the shallow zone ranges between 0.11 feet per year (ft/yr) to 0.39 ft/yr (Jacobs, 2002). The low groundwater velocity, coupled with partitioning of COCs onto the soil, is the main reason the groundwater plumes are generally stable or expanding slowly.

Based on the general direction of groundwater flow (towards the northeast), the following wells can be considered to be along the groundwater flow path for the TCE plume: 50WW22, 50WW13, 50WW05, 50WW16, and 50WW28. The COCs in upgradient well 50WW22 have remained below the cleanup levels. The TCE plume is more widespread whereas the perchlorate

plume appears narrower and occurring in the flow path of 50WW02, 50WW08, 50WW13, 50WW11, 50WW06, 50WW12, and 50WW18 or 50WW24 as downgradient wells, depending on groundwater flow direction, which appears to be influenced by groundwater levels. The center of the TCE plume appears to be around well 50WW13 and that of perchlorate is around well 50WW12, similar as observed during the 1st year RA(O) period.

In-plume well 50WW13 generally exhibits the highest levels of TCE which have increased during the 2nd year RA(O) monitoring period (see **Figure 3-1**). However, in comparison with the previous monitoring period (1st RA(O)) the TCE concentrations had dropped during the first half of this monitoring period before increasing again. The increase and decrease in concentrations over time appear seasonally affected by groundwater elevations and general groundwater flow direction. The lowest TCE concentrations in 50WW13 occurred in March 2014, June 2014, February 2015, and May 2015. The groundwater table elevation during these four events was higher or rising compared to the other four sampling events of November 2013, November 2014, August 2015, and November 2015, where the water table was lower or falling. The same analysis applies to the perchlorate concentration in 50WW13. A similar observation is also made for in-plume well 50WW11 for TCE and perchlorate. These observations are substantiated with the negative correlation coefficients between groundwater elevations and COC concentrations for the COCs in the 50WW11 and 50WW13. The correlation coefficients for 50WW11 between groundwater elevations and COC concentrations ranged between -38% and -77% and for 50WW13 between -16% and -78%.

TCE concentration in in-plume well 50WW05 appears to be stable with seasonal conditions and has a -37% correlation coefficient with groundwater elevation. TCE concentration in 50WW16 along the TCE flow path has decreased over the two year RA(O) period from above the MCL to below the MCL. This decrease indicates that natural attenuation is taking place in reducing the plume extent. Downgradient well 50WW28 remains unimpacted.

The highest levels of perchlorate are in well 50WW12. The perchlorate plume also appears to be stable, possibly even shrinking due to the concentration of perchlorate decreasing in 50WW08 to 32.4 J µg/L in November 2015 (upgradient well 50WW02 remains dry although historically this well contained perchlorate above the PCL with the most recent measurement of 110 µg/L reported on April 03, 2009). The perchlorate levels appear to fluctuate in well 50WW12 over the past two monitoring periods and show a slight overall increase over time; whereas the perchlorate level appears to increase and decrease seasonally within in-plume wells 50WW13 and 50WW11 over the same time period. Concentrations of perchlorate in in-plume well 50WW06 located between 50WW11 and 50WW12 appears to increase steadily over time with a statistically significant evidence of an increasing trend. 50WW06 is a lower shallow zone monitoring well with the top of the screen located at approximately 30 feet below the groundwater elevation. The increase in perchlorate concentration in this well indicates continued vertical expansion of the plume into the lower shallow zone. A similar observation cannot be made in co-located upper shallow zone well 50WW13 and lower shallow zone well 50WW14. In fact, TCE concentration in lower shallow zone well 50WW14 showed a statistically significant decrease over time. The contrary was observed in co-located wells 50WW08 and 50WW09, whereby TCE concentration increased in lower shallow zone well 50WW09 from 0.26 J µg/L in November 2013 to 173 µg/L in November 2015. Overall, concentrations of COCs away from the most impacted wells 50WW11, 50WW12, and 50WW13 have had no increase in

COC concentrations or detections of new COCs at boundary area wells 50WW28, 50WW18, 50WW19, 50WW07, 50WW23, and 50WW24 indicating no plume migration. The only exception to this trend is the perchlorate concentration in the May 2015 sample from 50WW23, which was reported above the PCL at 23.3 ug/L.

A review of the data in individual wells over the course of the monitoring period does not indicate any definite correlation between groundwater elevations and COC concentrations. **Figure 3-1** provides the groundwater level plotted along concentration profile over time for the shallow plume. Comparing the correlation coefficient for TCE with groundwater level for each of seven monitoring wells presented in **Figure 3-1** indicates a range of -77% (inverse correlation) to 62% (direct correlation). Similarly, comparing the correlation coefficients for perchlorate with groundwater level for each of seven monitoring wells presented in **Figure 3-1** indicates a range of -75% (inverse correlation) to 65% (direct correlation). These two sets of data indicate that there is no consistent response of COC concentration to groundwater level change. For most wells, the correlation coefficients of various COC concentration changes to groundwater level change are not similar. For example, for 50WW08, the TCE correlation coefficient is 62% and the perchlorate correlation coefficient is -50%. However, consistent correlations were observed for 50WW11 and 50WW14 between concentrations of all the COCs and groundwater elevations as discussed above. Both of these wells are screened in the upper shallow zone.

3.2 Second Line of Evidence: Geochemical Indicators

Table 3-1 identifies the wells that were chosen to be evaluated for MNA performance parameters. Some geochemical indicators are collected in the field, and are recorded for all sampling events for all wells. The field parameters for LHAAP-50 wells include: dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, conductivity, turbidity, and temperature.

DO is the most thermodynamically favored electron acceptor used by microbes for biodegradation of organic carbon, whether natural or anthropogenic (USEPA, 1998). Anaerobic bacteria generally cannot function at DO concentrations greater than about 0.5 milligrams per liter (mg/L) and hence, reductive dechlorination will not occur. DO levels during the 2nd year RA(O) monitoring are presented in **Table 2-3** and varied between 0 and 4.27 mg/L (50WW06 in February 2015). Most importantly, wells with COCs above the PCL/MCLs (50WW05, 50WW06, 50WW08, 50WW09, 50WW11, 50WW12, 50WW13, 50WW14, and 50WW15) had DO concentrations ranging between 0 and 1.6 mg/L with the exception of 50WW06 which had DO concentrations of 4.27 mg/L in February 2015, 3.56 mg/L in May 2015, 1.46 mg/L in August 2015, and 2.18 mg/L in November 2015. 50WW06 is the well that showed a significant increase in perchlorate concentration trend. The low DO concentrations in impacted wells (except in 50WW06) provide support for occurrence of anaerobic natural degradation of the COCs.

The ORP levels indicate how oxidative or reductive the groundwater is in the aquifer matrix and provide real-time data if conditions are conducive for anaerobic biodegradation. ORP values less than 50 millivolts (mV) are indicative that the aquifer is reaching anaerobic conditions and are favorable for the biological reductive dechlorination of chlorinated ethenes and ethanes. The ORP measurements at LHAAP-50 during the 2nd year RA(O) monitoring period ranged between -230 mV to 303 mV, indicating the presence of anaerobic and aerobic zones across the site. Of

the nine monitoring wells with concentrations of COCs above the cleanup levels, only monitoring wells 50WW06, 50WW09, 50WW14, and 50WW15 had recorded negative ORP values. These conditions are amenable to reductive dechlorination; however, the general conditions of the entire plume would be characterized as oxidative.

After DO has been depleted in the microbiological treatment zone, nitrate may be used as an electron acceptor for anaerobic biodegradation of organic carbon via denitrification. In order for reductive dechlorination to occur, nitrate concentrations in the contaminated portion of the aquifer must be less than 1.0 mg/L (USEPA, 1998). **Table 2-3** indicates that nitrate and nitrite concentrations were generally below the laboratory reporting limits in LHAAP-50 groundwater. Therefore, nitrate reduction is not a likely mode of microbial respiration at the site, and the lack of nitrate is favorable for achieving the highly reducing conditions ideal for anaerobic reductive dechlorination.

After DO and nitrate have been depleted in the microbiological treatment zone, sulfate may be used as an electron acceptor for anaerobic biodegradation. This process is termed "sulfate reduction" and results in the production of sulfide. Concentrations of sulfate greater than 20 mg/L may cause competitive exclusion of dechlorination. However, in many plumes with high concentrations of sulfate, reductive dechlorination still occurs (USEPA, 1998).

Table 2-3 indicates that the sulfate concentrations were above 20 mg/L in all wells where sulfate was analyzed during the 2-year RA(O) monitoring period (sulfate concentrations at the site ranged between 36.2 J mg/L and 926 mg/L, which is typical of this formation). Relatively high concentrations of sulfate and corresponding sulfide below laboratory reporting limit indicates that the conditions in the aquifer are generally not conducive for reductive dechlorination.

Methanogenesis occurs in highly reducing conditions and generally occurs after oxygen, nitrate, and sulfate have been depleted. Methane levels above 500 µg/L are considered to indicate methanogenic conditions (USEPA, 1998). Methane was measured in select wells for MNA evaluation and was generally found to be below 2 µg/L. The highest methane concentrations (between 31 µg/L and 110 µg/L) were reported for 50WW25, where the source of the contamination is from LHAAP-47. This well also exhibited generally low ORP values ranging between 86 mV and -237 mV during the 2-year RA(O) period. This well has no VOC concentrations but has perchlorate at a concentration ranging between < 0.20 µg/L and 42.2 µg/L. Monitoring well 50WW11 also exhibited relatively high levels of methane ranging between < 2 µg/L and 29.1 µg/L, likely associated with the presence of perchlorate and VOCs in this well.

Regardless of the electron acceptor being used, organic carbon is a required source of reduced carbon and energy to sustain microbial activity. Total organic carbon (TOC) is utilized as a carbon and energy source to support the reductive dechlorination of the chlorinated COCs. TOC concentrations greater than 20 mg/L are considered adequate to support microbial activity (USEPA, 1998). TOC concentrations were measured during this monitoring period in select wells and were found to range between 1.74 J mg/L and 149 mg/L with the majority of values below 20 mg/L. Alkalinity levels in the groundwater monitoring wells have generally remained between 200 and 400 mg/L and there is no significant difference in alkalinity levels in wells within and outside of the plume indicating any increased microbial activity.

The pH of groundwater has an effect on the presence and activity of microbial populations in groundwater. This is especially true for bacteria responsible for reductive dechlorination. Microbes capable of degrading chlorinated aliphatic hydrocarbons and petroleum hydrocarbon compounds generally prefer pH values varying from 6 to 8 standard units (USEPA, 1998). The shallow zone groundwater pH within the plume has been between 4.4 and 10.8 standard units. The highest pH values were reported in 50WW10, an intermediate well with surface casing. It is possible that the grout of the surface casing may contribute to the increase in pH level in groundwater measured in this well.

Ethane and ethene, the two end products of the reductive dechlorination pathways for chlorinated ethanes and ethenes, were also below the laboratory reporting limits during the 2nd year RA(O) monitoring period in wells 50WW01, 50WW06, 50WW08, 50WW11, 50WW12, 50WW13, 50WW14, 50WW18, 50WW22, 50WW23, and 50WW24. These results indicate that complete dechlorination within the plume is not taking place.

The qualitative assessment of geochemical indicators in the shallow groundwater zone at LHAAP-50 indicates current geochemical conditions are not optimal for biodegradation. Although degradation products (cis-1,2-DCE, 1,2-DCA, 1,1-DCE, and VC) have been detected in select plume monitoring wells, adequate conditions within the impacted area currently do not exist to sustain complete reductive dechlorination.

3.3 Third Line of Evidence: Predictive Modeling and Microbial Analysis

If the first two lines of evidence for MNA are deemed inadequate or inconclusive, and/or if the need for a contingency remedy is evaluated, data from field or microcosm studies will be necessary to establish the third line of evidence for MNA.

Dechlorinating bacteria (dehalococcoides ethenogenes and associated functional genes) were not analyzed at LHAAP-50. Therefore, this line of evidence cannot currently be evaluated.

Of the analyzed parameters and wells using Mann-Kendall trend analysis, only one parameter (TCE) showed a significant decrease in concentration over time in one well (50WW14). ProUCL was used to determine the best fit regression curve for the data set from which the first order rate constant was determined (**Appendix H**). For 50WW14, the first order rate constant was estimated at 0.548 yr^{-1} and the time to achieve the MCL of 5 µg/L from the November 2015 concentration of 5.78 µg/L is estimated at 0.26 years. Degradation of COCs in other wells is not occurring to such an extent to allow a determination of time to achieve the MCL (i.e., predictive modeling by assuming some degree of degradation and degradation half-lives is not meaningful for this plume). These determinations assume the rate of concentration decrease will continue at the same rate as calculated from recent data. However, the rate of reduction could diminish over time as the residual concentration decrease and the time frames to achieve the MCL might be longer than estimated.

Cleanup Levels

Perchlorate = 17 µg/L

1,1-Dichloroethene = 7 µg/L

1,2-Dichloroethane = 5 µg/L

cis-1,2-Dichloroethene = 70 µg/L

Tetrachloroethene = 5 µg/L

Trichloroethene = 5 µg/L

Vinyl chloride = 2 µg/L

Notes:

[1] The number of monitoring wells included in the network and the sampling frequency may be adjusted based on results of the initial data collection activities.

** - Field parameters to be monitored for all wells: pH, temperature, conductivity, turbidity, oxidation-reduction potential (ORP), dissolved oxygen (DO), and ferric iron.

*** - MNA parameters include alkalinity, sulfate, sulfide, chloride, TOC, dissolved iron and manganese, total phosphorus, carbon dioxide, dissolved gases (methane, ethane, ethene) and total iron.

X - Well will be analyzed for that parameter.

VOCs - volatile organic compounds.

4 SUMMARY AND CONCLUSIONS

VOC data and geochemical indicators were collected over the course of the monitoring period at LHAAP-50 to evaluate effectiveness of MNA as a site remedy. A tiered approach assessing the three lines of evidence was used to evaluate the occurrence of natural attenuation in site groundwater. The first line of evidence evaluated reductions in COC concentrations over time and with distance from source areas, the second line of evidence evaluated geochemical indicators, while the third line of evidence evaluated the projected time necessary to achieve the PCL/MCLs for wells that exhibited a significant decrease in trends in COC concentrations, based on the Mann-Kendall trend analysis. The results of the tiered evaluation and the conclusions are summarized below.

An assessment of the first line of evidence indicates that the plume is showing stable conditions but not decreasing in size. The low groundwater velocity, coupled with partitioning of COCs onto the soil, is the main reason the groundwater plumes are generally stable. The COCs in downgradient well 50WW12 have remained below the MCLs for VOCs with the exception of TCE. Concentrations of TCE increased to above the MCL during the 2nd year RA(O) monitoring period from less than the detection limit in February 2015. The TCE plume is more widespread than the perchlorate plume and generally follows the direction of groundwater flow to the northeast. The perchlorate plume is narrower than the TCE plume and also oriented toward the northeast but has a slightly different flow path. The center of the TCE plume appears to be around well 50WW13 and that of perchlorate is around well 50WW12. In-plume well 50WW13 exhibits the highest levels of TCE which have generally increased during the monitoring period; however, it initially decreased from the elevated levels observed in the 1st year RA(O) monitoring period. Over the two monitoring periods it appears that the increase and decrease in TCE levels is seasonal and correlated inversely with groundwater elevation. A similar trend is observed for the COCs in 50WW11 located cross-gradient or downgradient from 50WW13, depending on groundwater flow direction. TCE expansion to monitoring well 50WW12 was observed during the last three sampling events of the 2nd year RA(O) monitoring period.

The perchlorate plume also appears to be stable. The concentrations of perchlorate in 50WW12 fluctuate widely, continuing a trend observed during the previous 1st year RA(O) monitoring period. The perchlorate concentration in 50WW12 has a 65% correlation coefficient with groundwater elevation, indicating a direct correlation. The general trend of perchlorate concentrations in this well is upward but not statistically significant using the Mann-Kendall test. An increasing trend was observed for perchlorate in 50WW11 and 50WW13 during the 2-year RA(O) monitoring period but wide fluctuations in concentrations from event to event were observed. A review of perchlorate concentrations over the 2-year RA(O) monitoring period possibly reveals a seasonal trend of increasing and decreasing concentrations. Nonetheless, the seasonal concentration changes in these wells are poorly correlated with each other such that an increase in concentration in one well coincides with a decreasing concentration in the other well.

A review of the data in individual wells over the course of the monitoring period does not indicate any definitive correlation between groundwater elevations and COC concentrations. For example, comparing the correlation coefficient for TCE with groundwater level for each of seven monitoring wells (50WW05, 50WW06, 50WW08, 50WW11, 50WW12, 50WW13, and 50WW14) indicates a range of -77% (inverse correlation) to 62% (direct correlation). Similarly,

comparing the correlation coefficients for perchlorate with groundwater level for the same seven monitoring wells indicates a range of -75% (inverse correlation) to 65% (direct correlation).

Concentrations of COCs away from the most impacted wells 50WW11, 50WW12, and 50WW13 are not increasing according to the Mann-Kendall testing. There have been no new detections of COCs at boundary area wells 50WW28, 50WW18, 50WW19, 50WW07, 50WW23, and 50WW24 indicating no substantial plume migration, with the exception of the May 2015 sample from 50WW23, which had a perchlorate concentration of 23.3 µg/L, exceeding the PCL. The VOCs are not showing decreasing trends in the most highly-contaminated wells 50WW08, 50WW11, 50WW12, 50WW13, and 50WW05. The data in general show an increase in TCE/perchlorate concentrations at the center of the plumes in wells 50WW11, 50WW12, and 50WW13. This increase did not have any influence on the size of the plumes or the clean well status of downgradient perimeter wells.

The qualitative assessment of geochemical indicators in the shallow groundwater zone at LHAAP-50 indicates current geochemical conditions are not optimal for biodegradation. Although degradation products (cis-1,2-DCE, 1,2-DCA, 1,1-DCE, and VC) have been detected in select plume monitoring wells, adequate conditions within the impacted area currently do not exist to support complete reductive dechlorination.

Based on the data collected thus far, MNA associated with biodegradation appears to be very limited in the shallow groundwater at LHAAP-50 and the groundwater conditions are not supportive of reductive dechlorination. However, TCE appeared to be reducing in 50WW14 based on concentrations decreasing from 93.8 µg/L in October 2013 to 5.78 µg/L in November 2015. Simultaneously, there is evidence that cis-1,2-DCE concentration is increasing with a -29% correlation observed between TCE and cis-1,2-DCE during the 2-year RA(O) period. The changes in this well provide the best evidence of occurrence of localized reductive dechlorination in the shallow zone. The VOC and perchlorate plumes are currently stable and not showing any signs of downgradient migration.

Groundwater monitoring will continue to be performed at LHAAP-50 in compliance with the Remedial Action Work Plan (AECOM, 2013) until the proposed sampling optimization outlined in section 2.3.3 of this report is approved. No change in land or groundwater use has occurred at the site, and the use of the site is still consistent with that mandated by the ROD.

In October 2015 and December 2015, limited soil cover repair activities were completed in an area of perchlorate-contaminated surface soils at LHAAP-47, where erosion of the soil cover and exposure of the plastic liner were observed. The repair included placement of a new plastic liner and 6 inches of clean topsoil. The topsoil was seeded with rye grass and covered with erosion matting. The repair was conducted to prevent potentially exposed perchlorate-contaminated soil from impacting surface water in a ditch contributing to Goose Prairie Creek.

When surface water was present, water samples were collected from locations GPW-1A, GPW-1, and 50SW06 during this monitoring period as depicted in **Figure 2-11**. GPW-1A, located in a ditch north of LHAAP-50, had the highest detections of perchlorate at 38.2 µg/L (February 2015) and 16 µg/L (May 2015). This ditch empties into Goose Prairie Creek approximately 30 feet upgradient of GPW-1.

Two surface water sampling locations GPW-1 and 50SW06 are located in Goose Prairie Creek of which GPW-1 serves as a performance sampling location associated with the soil removal

action. 50SW06 is located downstream of GPW-1 and serves as the potential groundwater to surface water impact sampling point. The analytical results indicate the presence of low concentrations of perchlorate ranging between 0.737 µg/L and 0.139 J µg/L at GPW-1 and from 0.684 µg/L to 1.44 J µg/L at 50SW06 during the monitoring period. Those concentrations are below the PCL of 17 µg/L. Because the groundwater elevation has consistently been below the bottom of the drainage ditch at the surface water sampling locations, the methodology to sample surface water when the groundwater elevation is higher than surface water, as depicted in Appendix J of the Final RACR (AECOM, 2016), was not applied. In addition to the four quarterly sampling events, four surface water samples were collected from GPW-1 following rainfall events during the RA(O) monitoring period. Because perchlorate concentrations in surface water samples at locations GPW-1 and 50SW06 were below the PCL and VOC concentrations in 50SW06 were nondetect, the criteria specified in the RACR to sample surface water have been met. However, to provide documentation consistent with the RACR criteria, four additional quarters of surface water samples will be collected and during the same period an attempt to sample surface water during rainfall on up to four additional events will be made. Samples from 50SW06 will be analyzed for VOCs and perchlorate and samples from GPW-1 will be analyzed for perchlorate only.

A LUC compliance inspection was conducted in 2015. No change in land use has occurred.

Monitoring wells were inspected during the four 2015 monitoring events, and necessary well repairs and redevelopment were performed throughout the year. No damage to bollards, pads, or protective well casings was observed and minimal encroachment of weeds or brush on the well pads was observed. The LUC inspection and the well maintenance is documented in Appendices A and B, respectively.

APPENDIX A: Annual LUC Compliance Certification Documentation

Annual Land Use Control Compliance Certification Documentation

In accordance with the Remedial Design dated September 2011, for LHAAP-50 a certification of site was conducted by AECOM Technical Services, Inc. on July 4, 2015.

A summary of land use control mechanism is as follows:

- Groundwater restriction – restriction of the use of groundwater to environmental monitoring and testing until cleanup levels are met.

A summary of compliance with land use and restriction covenants is as follows:

- No use of groundwater, installation of new groundwater wells, or tampering with existing wells at LHAAP-50.

I, the undersigned, do document that the certification was performed as indicated above, and that the above information is true and correct to the best of my knowledge, information, and belief

Date: 3/23/2016

1 INTRODUCTION

AECOM reviewed twenty-one (21) data packages from Microbac Laboratory Services, Marietta, OH. Groundwater samples were collected February 12, 2015 through November 13, 2015 at the LHAAP-50 site at the Longhorn Army Ammunition Plant (LHAAP), Karnack, Texas. Data were reviewed for conformance to the requirements of the following guidance documents: Automated Data Review by Laboratory Data Consultants (ADR.net), United States Environmental Protection Agency (EPA) Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, (EPA, August 2014), and EPA Contract Laboratory Program National Functional Guidelines for Low Concentration Organic Data Review, (EPA, August 2014).

1.1 Intended Use of Data

The objective of this sampling event was to collect data for the Remedial Action Completion Report.

Analyses requested included:

- SW8260 – Volatiles by GC/MS
- SW6850 – Perchlorate by LC/MS/MS
- RSK 175 – Dissolved gases (methane, ethane, ethene, CO_2)
- E365.4 – Total Phosphorus
- E415.1 – Total Organic Carbon
- SW6010 – Fe (total and dissolved) by ICP
- SW6020 –Mn (dissolved) by ICP/MS
- SW9056 – Common Anions by ion chromatography (chloride, sulfate, nitrate, nitrite)
- E310.1 - Alkalinity
- E376.1 - Sulfide

Table 2 lists the sample identifications and their associated laboratory identifications. **Table 3** lists qualified results with the associated quality control parameter that was exceeded.

1.2 Preservation and Holding Times

Sample identification data were evaluated for agreement with the chain-of-custody (COC). All samples were received in appropriate containers, within the proper temperature range, in good condition, and with the required signatures excepted as noted below.

Samples L15021053-03, L15021053-07, L15021053-09, L15021053-11, L15021053-01, and L15021053-05 were extracted and/or analyzed outside of the required holding time for one or more of the following; nitrate, nitrite, sulfate, chloride. Sample concentrations are estimated (J/UJ).

1.3 Calibrations

Initial calibration criteria modification includes RSD< or = to 30%, two compounds allowed up to 40%. If the continuing calibration verification (CCV) compound exceeds 30% drift, the compound is checked in the LCS, if both are outside recovery limits, the compound is rejected, R. If only the CCV exceeds recovery criteria and is less than ± 40% drift, then the compound is qualified J or UJ.

1.3.1 Continuing Calibration Verifications (CCV)

1.3.1.1 SW8260

CCV WG512809-02 has recoveries for bromomethane at 79.8% in SDG L15020971. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG512985-02 has recoveries for dichlorodifluromethane at 77.6% in SDG L15021036 and L15021053. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG525816-02 has recoveries for carbon disulfide at 76.6% in SDG L15051620. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG526215-02 has recoveries for carbon disulfide at 76.8% in SDG L15051620. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG525986-02 has recoveries for carbon disulfide at 72% and 4-methyl-2-pentanone at 79.8% in SDG L15051620. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG526424-02 has recoveries for bromomethane 68.8%, carbon disulfide 75% and 4-methyl-2-pentanone at 77.8% in SDG L15051752. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG526670-02 has recoveries for carbon disulfide at 66% in SDG L15051752. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG535450-02 has recoveries for bromomethane 76.6% in SDG L15080904. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG535682-02 has recoveries for bromomethane 70.4% in SDG L15080992. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG536090-02 has recoveries for bromomethane 68.8% in SDG L15081073. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG536331-02 has recoveries for bromomethane 69% in SDG L15081251. This is outside of the control limits of 80-120%. Associated samples are non-detect and are UJ qualified.

CCV WG548398-02 has recoveries for 2-hexanone at 79%, and 4-methyl-2-pentanone at 75.6% at in SDG L151107931. Associated samples are non-detect and are UJ qualified.

CCV WG547460-02 has recoveries for 2-hexanone at 77%, and 4-methyl-2-pentanone at 74.2% at in SDG L15110943. Associated samples are non-detect and are UJ qualified.

CCV WG547466-02 has recoveries for 2-hexanone at 76.8% and 4-methyl-2-pentanone at 74.2% in SDG L15110950. Associate samples are non-detect and are UJ qualified.

Table 3 shows qualified analytical data.

1.3.2 Blanks

Where contamination by a target analyte of one of the various blanks was found, if the sample result for an associated sample was non-detect or less than 5X (10X for common laboratory contaminants) the analyte concentration in the blank, the corresponding sample result for the analyte was qualified J. Where the sample result for the affected analyte was greater than 5X the amount in the blank, no qualifier was applied.

All blanks were within acceptance criteria.

1.3.3 Surrogates

All surrogates are within criteria.

1.3.4 Laboratory Control Sample (LCS)

1.3.4.1 SW8260

LCS WG546844-02 has carbon disulfide at 31.5% recovery in SDG L15110793. Limits are 35-160%. Associated samples are non-detect and are UJ qualified.

LCS WG548399-02 has carbon disulfide at 22.3% recovery in SDG L15110793. Associated samples are non-detect and are UJ qualified.

LCS WG547466-02 has carbon disulfide at 33.2% recovery in SDG L15110943 and SDG L15110950. Associated samples are non-detect and are UJ qualified.

Table 3 shows qualified analytical data.

1.3.5 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

All MS/MSDs were within acceptance criteria.

1.3.6 Field Duplicate Precision

The RPD limit of ≤30% was met for all field duplicates collected with the exception of sample L15020878-02 and the duplicate sample L15020878-03. The RPD for perchlorate was at 34.8% which exceeds the ≤30% criteria.

Table 3 shows qualified analytical data.

2 DATA USABILITY SUMMARY

The data are usable for the intended purposes of the project. The data quality objectives have been met for the project.

Microbac

Laboratory Report Number: L15020878

Kayla Teague
AECOM Technical Services, Inc.
16000 Dallas Parkway
Dallas, TX 75248

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Stephanie Mossburg – Team Chemist/Data Specialist
(740) 373-4071
Stephanie.Mossburg@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on February 23 2015

David Vandenberg – Managing Director

State of Origin: TX
Accrediting Authority: Texas Commission on Environmental Quality ID:T104704252-07-TX
QAPP: DOD Ver 4.1

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
00112235	H	2.0		J2317161165	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Laboratory Data Package Cover Page

X	R1	Field chain-of-custody documentation;
X	R2	Sample identification cross-reference;
X	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
X	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	8260
Prep Batch Number(s):	512559	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	8260
Prep Batch Number(s):	512559	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?		X			1
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	8260
Prep Batch Number(s):	512559	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Microbac

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	8260
Prep Batch Number(s):	512559	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1) Trichloroethene was exceeded the control limit for percent recovery in the MSD.

X	R5	Test reports/summary forms for blank samples;
X	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
X	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
X	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
X	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
X	R10	Other problems or anomalies.

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG512778	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-20 00:00:00		

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?			X		
Were % moisture (or solids) reported for all soil and sediment samples?			X		
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG512778	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-20 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?	X				
Were MS/MSD analyzed at the appropriate frequency?	X				
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
Were MS/MSD RPDs within laboratory QC limits?	X				
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG512778	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-20 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?			X		
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies					

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020878
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG512778	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-20 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

2.2.1.2 QC Summary Data

Example Calculation 6850 - Perchlorate

Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of internal standard (IS) = Rx/Ristd

x = amount ratio = concentration analyte/concentration internal standard (IS) = Cx / Cistd

m = slope from curve (1.45)

b = intercept from curve (-0.00242)

y = 1.45x + -0.00242

Step 2: Substitute the value for y

where y = 12600/226000 = 0.055752

Step 3: Solve for x

x = (y - b)/m = 0.0040119

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(x) = (5 ug/L)(0.040119) = 0.200594 ug/L

Example Calculation - Water:

Slope from curve, m:	1.45
Intercept from curve, b:	-0.00242
Response of analyte, Rx:	12600
Response of Internal Standard , Ristd:	226000
Concentration of IS, Cistd (ug/L):	5.00
Response Ratio:	0.05575
Amount Ratio:	0.04012
Analyte Concentration, Cx (ug/L) :	0.200594

Example Calculation - Soil:

Analyte Concentration, Cx (ug/L):	0.20059
Amount of soil extracted (g):	5.00
Final volume of extract (mL):	50.00
Percent solids (Pct wt.)	100
Concentration in soil (ug/kg):	2.005938

List of Valid Qualifiers
February 23, 2015

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B,H1	Analyte present in method blank. Sample analysis performed past holding time.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
CT1	The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
H1	Sample analysis performed past holding time.
H1,CT1	Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guidelines for reque
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ.
J,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
J,H1	Estimated value ; the analyte concentration was less than the LOQ. Sample analysis performed past holding time.
J,H1	The reported result is an estimated value. Sample was analyzed past holding time.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL/MDL).
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
ND,H1	Not detected; Sample analysis performed past holding time.
ND,H1,CT1	Not detected; Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guide
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
Q,H1	One or more quality control criteria failed. Sample analyzed past holding time. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
TNTC, B	Too numerous to count. Analyte present in method blank.
TNTC,CT1	Too numerous to count. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.

Microbac Laboratories Inc.
List of Valid Qualifiers
February 23, 2015

Qualkey: DOD

TNTC,H1	Too numerous to count. Sample analysis performed past holding time.
U	Analyte was not detected. The concentration is below the reported LOD.
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - May 22, 2014

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVL NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Thiodiglycol (TDG-LCMS)
Acetate (HPLC-UV)
Formate (HPLC-UV)
Acetaldehyde (HPLC-UV)
Propionaldehyde (HPLC-UV)
Fluoroborate (ISE)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVL MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam

Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVL MSV0I/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVL RSKOI/GC-FID

Isobutane
n-Butane
Propane
Propylene
Propyne

OVL HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

SOLID AND HAZARDOUS CHEMICALS

OVL MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVL MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
n-Hexane
T-amylmethylether (TAME)

Microbac

Laboratory Report Number: L15020971

Kayla Teague
AECOM Technical Services, Inc.
16000 Dallas Parkway
Dallas, TX 75248

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

Laboratory Contact:
Stephanie Mossburg – Team Chemist/Data Specialist
(740) 373-4071
Stephanie.Mossburg@microbac.com

I certify that all test results meet all of the requirements of the DoD QSM and other applicable contract terms and conditions. Any exceptions are attached to this cover page or addressed in the method narratives presented in the report. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories, DoD ELAP certification number 2936.01. The reported results are related only to the samples analyzed as received.

This report was certified on March 02 2015

David Vandenberg – Managing Director

State of Origin: TX
Accrediting Authority: Texas Commission on Environmental Quality ID:T104704252-07-TX
QAPP: DOD Ver 4.1

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #	Temp Required?
00112086	I	2.0		J2317161192	X

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct preservatives used? (water only)	Yes
11	Were pH ranges acceptable? (voa's excluded)	Yes
12	Were VOA samples free of headspace (less than 6mm)?	Yes

Case Narrative

Login Number: L15020971
Department: Metals
Analyst: Brendan Torrence

METHOD

Preparation: SW-846 3015

Analysis: SW-846 6020

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Interference Check Standards: All acceptance criteria were met.

Continuing Calibration: All acceptance criteria were met.

Continuing Calibration Blank: All acceptance criteria were met.

Low Level Check: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Serial Dilution/Post Digestion Spikes: WG513055 - All acceptance criteria were met.

Matrix Spikes: All acceptance criteria were met.

SAMPLES

Samples: All acceptance criteria were met.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	8260
Prep Batch Number(s):	512811	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971

Prep Batch Number(s):	512811	**Reviewer Name:**	Franci Bolden
LRC Date:	2015-02-20 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?		X			1
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG513051	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-24 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	6850
Prep Batch Number(s):	WG513051	**Reviewer Name:**	Eric Lawson
LRC Date:	2015-02-24 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

LRC Date:	2015-02-24 00:00:00		

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

Laboratory Data Package Cover Page

	R1	Field chain-of-custody documentation;
	R2	Sample identification cross-reference;
	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
	R5	Test reports/summary forms for blank samples;
	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
	R10	Other problems or anomalies.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports	X				
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?			X		
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):	X				
Were all COCs included in the LCS?	X

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?			X		
Were % moisture (or solids) reported for all soil and sediment samples?			X		
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?	X				
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	9056
Prep Batch Number(s):	WG512917	**Reviewer Name:**	Allen Davis
LRC Date:	2015-02-19 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					1
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?			X		
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	9056
Prep Batch Number(s):	WG512917	**Reviewer Name:**	Allen Davis
LRC Date:	2015-02-19 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?			X		
Were ion abundance data within the method-required QC limits?			X		
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?			X		
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?			X		
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?	X				
Method detection limit (MDL) studies

Was a MDL study performed for each reported analyte?	X				
Is the MDL either adjusted or supported by the analysis of DCSs?	X				
Proficiency test reports					
Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
Standards documentation					
Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
Compound/analyte identification procedures					
Are the procedures for compound/analyte identification documented?	X				
Demonstration of analyst competency (DOC)					
Was DOC conducted consistent with NELAC Chapter 5?	X				
Is documentation of the analyst's competency up-to-date and on file?	X				
Verification/validation documentation for methods (NELAC Chapter 5)					
Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
Laboratory standard operating procedures (SOPs)					
Are laboratory SOPs current and on file for each method performed	X				

1. Items identified by the letter “R” must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter “S” should be retained and made available upon request for the appropriate retention period;

2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);

3. NA = Not applicable;

4. NR = Not reviewed;

5. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

The Exception Report for each “No” or “Not Reviewed (NR)” item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature

below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [ ] This laboratory meets an exception under 30 TAC §25.6 and was last inspection by [ ] TCEQ or [ ] _____ on **(enter date of last inspection**). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Exceptions Report

1. Fractions -06,08,10, and 14 were analyzed at dilutions only due to their high analyte concentrations (Cl and/or SO4) which were over 200 ppm. Any sample that has a single anion load greater than 200 ppm (or a total anion load greater than 400 ppm) will be diluted in order to prevent damage to the IC from repeated overloading of the analytical column and oversaturation of the suppressor membranes.

Laboratory Data Package Cover Page

	R1	Field chain-of-custody documentation;
	R2	Sample identification cross-reference;
	R3	Test reports (analytical data sheets) for each environmental sample that includes: (a) Items consistent with NELAC Chapter 5, (b) dilution factors, (c) preparation methods, (d) cleanup methods, and (e) a.if required for the project, tentatively identified compounds (TICs).
	R4	Surrogate recovery data including: (a) Calculated recovery (%R), and (b) the laboratory's surrogate QC limits.
	R5	Test reports/summary forms for blank samples;
	R6	Test reports/summary forms for laboratory control samples (LCSs) including: (a) LCS spiking amounts, (b) calculated %R for each analyte, and (c) the laboratory's LCS QC limits.
	R7	Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including: (a) samples associated with the MS/MSD clearly identified, (b) MS/MSD spiking compounds, (c) concentration of each MS/MSD analyte measured in the parent and spiked samples, (d) calculated %Rs and relative percent differences (RPDs), and (e) the laboratory's MS/MSD QC limits.
	R8	Laboratory analytical duplicate (if applicable) recovery and precision: (a) the amount of analyte measured in the duplicate, (b) the calculated RPD, and (c) the laboratory's QC limits for analytical duplicates.
	R9	List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
	R10	Other problems or anomalies.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification					
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?			X		
Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
Test reports/summary forms for blank samples					
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):	X				
Were all COCs included in the LCS?	X				

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L15020971
Project Name:		**Method:**	S
Prep Batch Number(s):	WG513077	**Reviewer Name:**	Deanna Hesson
LRC Date:	2015-03-02 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?	X				
Were analytical duplicates analyzed at the appropriate frequency?	X				
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?			X		
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Texas Risk Reduction Program (TRRP) Checklist

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L
