2.1.2.2 QC Summary Data

RSK-175 - Example Calculation for Methane

1.0 Linear Calibration Models

Option A - Average RF Method

ICAL_x	ICAL_r		RF
1.67	19901		11917
6.67	69174		10371
16.7	176923		10594
66.7	685135		10272
133	1324853		9961
300	2845104		9484
		Average RF:	**10433**

Where:
ICAL_x = the ICAL concentration
ICAL_r = the ICAL response (area)
RF = calibration factor = ICAL_r / ICAL_x

Option B - Agilent Linear Regression Constant

ICAL_x	ICAL_r	[ICAL_r}^2	[ICAL-x][ICAL-r]
1.67	19901	396049801	33235
6.67	69174	4785042276	461391
16.7	176923	31301747929	2954614
66.7	685135	4.6941E+11	45698505
133	1324853	1.75524E+12	176205449
300	2845104	8.09462E+12	853531200
Summation:		**1.03557E+13**	**1078884393**

Agilent Linear Regression Constant : **9598.567853**
(1.03557E+13)/1078884393)

2.0 Calculate the concentration in extract, Cx

Where:	
y = area response of methane from quant report	**1157414**
a = average RF (or Agilent regression constant)	**10433.00**
Cx = y/a	**110.9377935**

3.0 Calculate the concentration in sample

Cs = Cx (MW/Tf) (HS/S) (DF)

Where:		
Cx = Concentration in extract	**110.9377935**	umol/mol
MW = molecular weight of analyte	**16.04**	ug/umol
TF = temperature factor = (22.4)(313/273)	**25.68**	L/mol
HS = headspace volume	**0.015**	L
S = sample volume remaining after headspace removal	**0.00547**	L
DF = dilution factor	**2**	
Cs = calculated sample concentration	**380.034301**	ug/L

RSK-175 - Example Calculation for Carbon Dioxide

ICAL Plot - Quadratic Regression (y = Ax^2 + Bx +C)

Ax^2 + Bx + (C - y) = 0

Step 1 - Calculate the concentration in extract, Cx

Data from quadratic regression plot:		
Value of A from plot:	**0.916**	
Value of B from plot:	**1540**	
Value of C from plot:	**0**	
Response for methane from quantitation report (y):	**8763828**	
Value of C - y	**-8763828**	
Solving for Cx using the quadratic formula:		
Root 1 - Computed Cx1:	**2364.716284**	umol/mol
Root 2 - Computed Cx2:	**-4045.938991**	

Step 2 - Calculate the concentration in sample

Cs = Cx (MW/Tf) (HS/S) (DF)

Where:

Cx = Concentration in extract :	**2364.716284**	umol/mol
MW = molecular weight of analyte:	**44.0**	ug/umol
TF = temperature factor = (22.4)(313/273):	**25.68**	L/mol
HS = initial headspace volume (extraction log):	**0.015**	L
S = final volume (extraction log):	**0.00547**	L
DF = dilution factor:	**10**	
Cs = calculated sample concentration:	**111106.798**	ug/L

Other Notes:

Temperature of headspace = 40 C = 313 K

Analyte	MW (g/mol)
Methane	16.04
Ethane	30.07
Ethene	28.05
Propane	44.1
Carbon Dioxide	44.0

2.2.1.2 QC Summary Data

Example Calculations - Ion Chromatography

A. Methods 9056/300.0 (Quadratic with Offset)

1. Retrieve Curve Data from the ICAL Curve

c2 = the value of curve constant
c1= the curve slope
c0 = the curve offset

2. Obtain the area, y , from the instrument raw data

3. Calculate the concentration of the analyte, f(y), where:

$$f(y) = \frac{1}{2 * c_2} * \left(- c_1 \pm \sqrt{c_1^2 - 4 * c_2 * (c_0 - y)} \right)$$

Example Calculation:

Value of constant, c2, (curve):	0.0003
Value of curve constant, c1, (slope):	0.0869
Value of curve constant, c0, (offset):	-0.0103
Area of target analyte, y, (uS*min):	2.993
Calculated concentration, f(y), (mg/L):	31.1998864
or:	-40.1161215 *
Dilution factor (D):	1.00
Concentration of analyte in sample (mg/L):	31.200

* There are two possible solutions, but only one is valid.

B. Method 314.0 - Perchlorate (Linear)

Retrieve Curve Data from Linear Plot

c1 = the curve slope

Obtain the area, y , from the quantitation report

Calculate the concentration of the analyte, f(y), where:

f (y) = y / c1

Example Calculation:

Value of c1, slope:	0.0034
Area of target analyte, y:	0.083
Calculated concentration:	24.4117647
Dilution Factor:	1
Concentration in sample:	24.4117647

2.2.2.2 QC Summary Data

Example Calculations for Visible Spectrophotometric Methods

Linear Calibration Model

Step 1 - Retrieve Curve Data from ICAL

m = slope of the linear equation
b = intercept from the linear equation
y = instrument response as absorbance or OD
x = concentration of analyte (mg/L)
y = mx + b

Step 2: Calculate the instrument concentration, x

Where:

x = (y - b)/m

Step 3: Solve for analyte concentration in sample, Cx

Cx = (x) (D)

Example Calculation (LCS):

Value of m from plot:	7.809	
Value of b from plot:	0.0004135	
Absorbance of unknown from quantitation report (y):	0.31	
Calculated concentration (x):	0.03964483	
Dilution factor (D):	1.00	
Concentration of analyte in sample, Cy:	0.0396	mg/L

SmartChem Autoanalyzer - Quadratic Calibration for Chloride and Sulfate

Step 1 - Retrieve Curve Data from Smartchem ICAL

A, B, C = constants from the ICAL quadratic regression

x = instrument response as absorbance or OD

y = concentration of analyte (mg/L)

Step 2: Calculate the instrument concentration, y

Where:

y = Ax^2 + Bx + C

Step 3: Solve for analyte concentration in sample, Cy

Cy = (y) (D)

Example Calculation (LCS):

Value of A from plot:	101.2796	
Value of B from plot:	318.9056	
Value of C from plot:	-2.2712	
Absorbance of unknown from quantitation report (x):	0.1583	
Calculated concentration (y):	50.7495108	
Dilution factor (D):	1.00	
Concentration of analyte in sample, Cy:	50.75	mg/L

2.2.3.2 QC Summary Data

Example Total Sulfide(Liquid) Calculations

[mL Iodine * N Iodide) - (mL titrant * N titrant)] * 16000/(volume * dilution) = mg/L Sulfide

where:

mL Iodine = mL of Iodine used
N Iodine = normality of Iodine
mL titrant = mL of titrant used
N titrant = normality of titrant
16000 = factor: 1mL of 0.025 N iodine reacts with 0.4mg sulfide
volume = mL filtered of mL titrated(if not filtered)
dilution = dilution in decimal form (1/5 = 0.2)

Example Total Sulfide(Soil) Calculations

[(mL Iodine * N Iodine) - (mL titrant * N titrant)] * 16.03/weight = mg/kg sulfide

where:

mL Iodine = mL of Iodine used
N Iodine = normality of Iodine
mL titrant = normality of titrant
16.03 = 32.06 grams per 2 equivalents
weight = kg of sample used

2.2.4.2 QC Summary Data

Total Organic Carbon Example Calculations
(Direct Readout Parameter)

(Readout)/(dilution) = mg/L

where:

Readout = direct readout from the instrument
dilution = dilution in decimal form (ex. 1/5 dilution = 0.2)

Microbac Laboratories Inc.
List of Valid Qualifiers
May 31, 2016

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B,H1	Analyte present in method blank. Sample analysis performed past holding time.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
CT1	Cooler temperature at sample reciept exceeded regulatory limit.
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
E,CT1	Estimated results. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
FP1	Did not ignite.
H1	Sample analysis performed past holding time.
H1,CT1	Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guidelines for reque
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value ; the analyte concentration was less than the LOQ. Cooler temperature at sample reciept exceeded regu
J,H1	Estimated value ; the analyte concentration was less than the LOQ. Sample analysis performed past holding time.
J,H1	The reported result is an estimated value. Sample was analyzed past holding time.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL)
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
ND,H1	Not detected; Sample analysis performed past holding time.
ND,H1,CT1	Not detected; Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guide
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
Q,H1	One or more quality control criteria failed. Sample analyzed past holding time. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
T5	Laboratory not licensed for this parameter
TIC	Library Search Compound
TNTC	Too numerous to count

Microbac Laboratories Inc.
List of Valid Qualifiers
May 31, 2016

Qualkey: DOD

TNTC, B	Too numerous to count. Analyte present in method blank.
TNTC,CT1	Too numerous to count. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
TNTC,H1	Too numerous to count. Sample analysis performed past holding time.
U	Analyte was not detected. The concentration is below the reported LOD.
U,CT1	Analyte was not detected. The concentration is below the reported LOD. Cooler temperature at sample reciept exceeded
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - January 4, 2016

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVD NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Propionaldehyde (HPLC-UV)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1
ASTM D3987-06

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVD MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam
Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD MSV01/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVD HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

OVD HPLC12/HPLC/UV

Acetate
Formate

OVD RSK01/GC-FID

Acetylene
Propane

OVD K9305/ISE

Fluoroborate

SOLID AND HAZARDOUS CHEMICALS

OVD MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

APPENDIX E: MANN-KENDALL TREND TEST RESULTS

Mann-Kendall analysis for the data collected during the 3-year RA(O) period was completed for 1,1-DCE, 1,2-DCA, and TCE. The U.S. EPA's ProUCL version 5.0 was used for this analysis. The dates are displayed in numerical format rather than in a date format as required by the program. The concentration of COCs are presented on the data points on the graph in µg/L. Half of the detection limit was used for non-detects, where applicable. The level of significance was 5%. A summary table of the Mann-Kendall results is presented below, followed by the trend analysis for each well and analyte.

Mann-Kendall Trend Summary

Monitoring Well	1,1-DCE	1,2-DCA	TCE
67WW01	**Significant Increase**	**Significant Increase**	No significant trend
67WW02	No significant trend	No significant trend	No significant trend
67WW08	No significant trend	No significant trend	No significant trend
67WW09	**Significant Decrease**	**Significant Decrease**	No significant trend
67WW11	**Significant Decrease**	**Significant Decrease**	No significant trend
67WW13	No significant trend	**Significant Increase**	No significant trend

EXECUTIVE SUMMARY

The operation of the Groundwater Treatment Plant (GWTP) is part of the Interim Remedial Action (IRA) at Burning Ground No. 3, also referred to as Longhorn Army Ammunition Plant (LHAAP)-18/24. A historical pilot test for nearby landfill LHAAP-16 resulted in the installation of eight extraction wells which also contribute groundwater to the GWTP. Groundwater extraction, treatment, and monitoring activities consist of:

- Continuous extraction of groundwater from multiple interception-collection trenches (ICTs) and extraction wells at both LHAAP-18/24 and LHAAP-16;
- Treatment of extracted groundwater for heavy metals, chlorinated compounds, and perchlorate using precipitation, air stripping, and biological methods, respectively;
- Evaluation of the hydraulic effectiveness of the extraction system by groundwater monitoring;
- Monitoring of treated water to ensure compliance with the discharge limitations; and
- Discharge of treated water to Harrison Bayou (if flowing), or to the INF Pond (if no flow in Harrison Bayou), or release of treated water as irrigation water on LHAAP-18/24 (if INF Pond is full).

The location of the extraction wells and ICTs are included in **Figure A-1** of **Appendix A**. The process flow diagram of the GWTP is also included in **Figure A-2** of **Appendix A**.

Figure ES-1 depicts the monthly total volume of groundwater extracted from the ICTs and extraction wells at LHAAP-18/24 and LHAAP-16 between March 2012 and June 2016.

The GWTP was not operational during June, July, and August 2012 when the scrubber system associated with the catalytic oxidizer melted due to system overheating. Overheating occurred when the blower became inoperable after the bearing on the scrubber blower unit was shattered and damaged the blower. This occurred around 1:00 PM on May 21, 2012.

After developing an interim air monitoring plan and obtaining concurrence from the Texas Commission on Environmental Quality (TCEQ) and the United States Environmental Protection Agency (USEPA) to operate the GWTP without use of air abatement equipment, a pilot run of the GWTP was conducted on September 6, 2012. In that first pilot run, 85,170 gallons of water that had been stored in the influent tank (TK-140) were treated. The treated water was re-circulated through the fluidized bed reactor (FBR) to revive the FBR after three months of dormancy. Treated groundwater and air samples were collected and analyzed respectively for perchlorate, metals, and volatile organic compounds (VOCs); and VOCs only. On September 19, 2012, a second pilot run was performed at the GWTP and 107,264 gallons of water were treated. Based on the successful re-start of the GWTP, continuous groundwater extraction began again on September 24, 2012. While groundwater extraction occurs on a continuous basis, operation of the GWTP occurs intermittently due to the low volume of water available for treatment with respect to the design capacity of the GWTP. During the 3rd quarter 2012, groundwater extraction occurred only from LHAAP-18/24. Groundwater extraction from LHAAP-16 was not performed due to equipment failure. However, extraction from LHAAP-16 began in October 2012 and the extraction volumes increased steadily throughout the 4th quarter

2012, as pumping equipment was gradually repaired/replaced. The GWTP operated under normal conditions until September 2015.

On September 14, 2015 at 11:15 am, the blower on the air stripper (BL-340) malfunctioned during routine operation. The wiring on the blower was repaired and the blower operated for less than 2 hours on September 17, 2015, when the blower malfunctioned again. It was determined that the blower needed to be replaced, and groundwater extraction and operation of the GWTP ceased beginning September 18, 2015, as the influent equalization tank (TK-130) became full. Beginning on October 2, 2015 it was determined that the GWTP could operate without the blower at a reduced extraction rate. The operation of the GWTP allowed extraction of groundwater from ICTs 12E, 13A, 13B and 13C (13C was changed to ICT 13E on October 12, 2015), which were considered critical ICTs to prevent migration of contaminants to Harrison Bayou. Groundwater extraction was switched frequently between ICTs 12E, 13A, 13B and 13E and ICTs 14B, 14C and 14D beginning December 14, 2015.

As indicated in **Figure ES-1**, groundwater extraction from LHAAP-18/24 ranged between approximately 1,085,700 and 1,297,000 gallons per month and extraction from LHAAP-16 ranged between 78,700 gallons and 85,600 gallons per month during the 2nd quarter 2016. These extraction volumes were notably higher than volumes extracted in the previous quarter and are primarily influenced by substantial cumulative rainfall during the quarter. A total of approximately 3,735,000 gallons of groundwater from LHAAP-18/24 and 16 were extracted during the 2nd quarter of 2016 compared to approximately 2,709,000 gallons during the 1st quarter 2016. The extracted groundwater volume was measured on a monthly basis as the sum of the ICTs flow meter totalizers' differences between the beginning and end of each month.

The average discharged volume from the GWTP was estimated at 21.86 gallons per minute (gpm) during the 2nd quarter 2016. Grab perchlorate samples from the GWTP influent were collected on April 27th, May 9th, and June 6th, 2016 and the following perchlorate concentrations were reported: 9,850 micrograms per liter (µg/L), 11,100 µg/L and 14,000 µg/L, respectively. The average perchlorate concentration in the influent to the GWTP during the quarter was 11,650 µg/L. Perchlorate concentrations in several samples exceeded the effluent (TK650) limits during the quarter. Samples that did not meet the discharge limit for perchlorate were collected on April 4, 11, 18 and 25, 2016 and May 4 and 9, 2016 with reported effluent concentrations of 810, 131, 174, 36.1, 264 and 131 ug/L, respectively. The cause of these exceedances is likely in relation to failure of the nutrient feed pump (P-103) that occurred on April 5, 2016 which hindered FBR performance. A temporary pump was used until the permanent replacement was installed on April 19, 2016. No discharge to Harrison Bayou occurred during the 2nd quarter 2016.

No treated water was returned to ICTs 6 and 9 during the 2nd quarter of 2016, because this practice was discontinued after system restart in September 2012. The treated water quantities returned to LHAAP-18/24 through the injection system each month since January 2008 are shown on **Figure ES-2**.

Approximately 2,833,000 gallons of treated water was returned to LHAAP-18/24 through the sprinkler system during the 2nd quarter 2016. No discharge from the GWTP to Harrison Bayou or the INF pond occurred during this quarter.

The groundwater volume processed at the GWTP ranged from high of approximately 1,224,000 gallons in April 2016 to a low of approximately 792,000 gallons in June 2016. Total water processed for the quarter was approximately 3,110,000 gallons. The three month average was approximately 1,037,000 gallons per month. The water quantities treated each month since June 2012 are shown on **Figure ES-3**. The volume of water processed (3,110,000 gallons) is higher than the volume of water discharged (2,833,000 gallons). The reason for the difference is the change in volume stored in/released from the GWTP, inaccuracies associated with flow measurements, the amount of water lost with the removed metals precipitation sludge, the amount of evaporative water lost in the air stripper (which is counted in the volume extracted but not the volume discharged), and the amount of water returned to TK-140 directly from rain water, filter press water, thickeners' decant water, decontamination water on the decon pad, and from any potential plant water losses captured within the containment area that might occur after the process water volume is measured (these sources are captured in the water discharged but not in the volume extracted). Additionally, there is an internal system recirculation loop that adds to the total measured volume of processed water compared to the total volume discharged.

The difference between the volume of water extracted, 3,735,000 gallons, and the water volume returned to 18/24, approximately 2,833,000 gallons, is associated with the cumulative errors associated with the individual flow meters at the various ICTs. When comparing the total volume of water extracted as measured by FIT-140 (influent flow meter) and FIT-686 (effluent flow meter), the flows appear comparable. The total flow measured by FIT-140 was approximately 2,695,000 gallons and the total flow measured by FIT-686 was approximately 3,042,000 gallons, which are comparable to each other with a difference of 12%.

1 EVALUATION OF GWTP

The groundwater contamination at LHAAP-18/24 is believed to be the result of infiltration from an Unlined Evaporation Pond (UEP) that was used to store manufacturing wastewater, and from burning trenches, and other industrial processes used to flash pyrotechnic, propellant, and explosive waste streams. The GWTP was constructed as part of the Interim Remedial Action (IRA) at Burning Ground No. 3, also referred to as LHAAP-18/24, to treat groundwater extracted from interception-collection trenches (ICTs) and extraction wells. The groundwater at LHAAP-18/24 is contaminated primarily with chlorinated ethenes and perchlorate, with lesser concentrations of 1,4-dioxane.

The GWTP also receives flow from eight extraction wells installed at LHAAP-16 as part of a historical treatability study. The extraction wells were installed in 1996 and 1997. The wells are located between the landfill at LHAAP-16 and Harrison Bayou. The groundwater at LHAAP-16 is also contaminated primarily with chlorinated ethenes and perchlorate.

1.1 Treatment Configuration

The GWTP was not operational between May 24, 2012 and September 6, 2012, due to malfunction of the scrubber unit associated with the catalytic oxidizer. Since September 6, 2012, the GWTP has operated without air abatement equipment. Although major repairs were conducted to the GWTP (e.g., replacement of level alarms, repair of the hydrochloric acid tank, replacement of TK-650, replacement of malfunctioning valves and flow meters, replacement of metering pumps, repair or replacement of various system pumps, rust removal and repainting of various tanks, and replacement and repair of various extraction pumps, motors, and level switches), the GWTP treatment configuration remained unchanged.

Malfunction of the blower on the air stripper (BL-340) on September 14, 2015 and on September 17, 2015 disrupted continuous extraction and routine operations of the GWTP, which lasted through January 7, 2016. Prior to this occurrence, the GWTP performed as designed and the GWTP was operated on an as needed basis (i.e., on semi-continuous operational basis). During the 4th quarter 2015, groundwater was extracted from a limited number of ICTs (ICTs 12E, 13A, 13B, 13C, and/or 13E, or ICTs 14B, 14C and 14D). Operation of the GWTP occurred on a batch basis through the FBR. After replacement of the blower, attempts were made to restore continuous operations to the FBR but remained predominantly on a batch basis throughout January 2016.

In general, the GWTP performed as designed during the 2nd quarter 2016 but the FBR performance remained challenged as discussed previously. While groundwater extraction occurred continuously since January 7, 2016, operation of the GWTP occurred on the following days: April 1, 4, 7, 11, 14, 18, 21, 22, 25, 27, and 29, 2016, May 4, 6, 9, 12, 15, 16, 19, 20, 25, and 27, 2016, and June 2, 3, 8, 10, 20, 23, and 27, 2016. Flow rates for the treatment processes for metals and VOCs ranged between 111 and 225 gpm with an average of approximately 200 gpm for the operating hours (i.e., this flow rate does not represent continuous flows). The GWTP operated for 259 hours during the quarter. The process flow diagram is included as **Figure A-2** of **Appendix A**. The treatment configuration of the plant at these rates (with minor variations) is as follows:

GWTP Metals Precipitation Operating Parameters

Pretreatment Settings	Tank 200-A $Mg(OH)_2$ Mixing	Tank 200-B NaOH Mixing	Tank 200-C Polymer Mixing	Tank 300 feed line to Air Stripper
pH Adjustment	9.0	10.5	NA	5.0 to meet ≤ 8.0 release from stripper
Feed Pump Settings	Speed 100% Stroke 100% 10 gph $Mg(OH)_2$	Speed 100% Stroke 100% 9.0 gph NaOH	Speed 90% Stroke 100% 40 gph water	Speed 80% Stroke 80% 10 gph HCl

Notes:

gph gallons per hour
HCl hydrochloric acid
$Mg(OH)_2$ magnesium hydroxide
NaOH sodium hydroxide
NA not applicable

GWTP Air Compressors Operating Parameters

Air Compressors	K-700A	K-700B	K-701
Air Pressure Settings	88 psi	88 psi	105 psi

Notes:

psi pounds per square inch

GWTP Stripper Operating Parameters

Stripper Tower	
pH Settings	7.4
Inlet Pressure Gauge	2 inches of water
Stripper Pressure Gauge	3 inches of water
Air Flow Rate	4,285 to 4,690 cfm

Notes:

cfm cubic feet per minute

GWTP Fluidized Bed Reactor (FBR) Operating Parameters

Fluidized Bed Reactor	
Carbon Bed Height	12 feet 1 inch
Recycle Flow Rate	23 to 36% of influent
pH	7.1 to 7.4
Recycle oxidation-reduction potential (ORP)	-430 mV to -452 mV

Notes:

gpm gallons per minute
mV millivolts
ORP oxidation reduction potential

Pump pressures and valve settings are not listed as they are changed regularly based on pH, flow rate, and water quality changes. The ORP was within the specified range.

1.2 Work Performed at the GWTP

Work performed at the GWTP during the 2nd quarter of 2016 is described in the following subsections.

1.2.1 Major Maintenance

- Glenmount Global was on site on 4/21/2016 to restore communication between the computer and the programmable logic controller (PLC).
- AEI was on site for drilling activities at LHAAP-18/24, LHAAP-37, and LHAAP-67.

1.2.2 Emergency Responses

- There were no call outs during this quarter.

1.2.3 Routine Maintenance

The following routine maintenance and improvement activities were completed during the reporting period:

- Replaced nutrient pump P-103 on FBR.
- Tightened belts and greased bearings on blower.
- Removed plug from suction piping of P-320.
- Replaced coupling in P-710 at TK-700.
- Repaired clarifier pump P-170.

1.2.3.1 Safety

- No safety equipment maintenance or purchases were made during the reporting period.

1.2.3.2 Lubrication

- No lubrication activities were reported during this period.

1.2.3.3 Air Compressors

- No maintenance was performed on the air compressors during this period.

1.2.3.4 Belt Press and Waste Disposal

- Collected filter cake samples.

1.2.3.5 Catalytic Oxidation & Continuous Emission Monitor System

- Catalytic oxidizer was not operated during the reporting period.

1.2.3.6 Sand Filter

- No maintenance or repairs were conducted on the sand filter.

1.2.3.7 Well Field at LHAAP-18/24

- Collected monthly ICT flowmeter readings.
- Collected monthly groundwater levels in all wells.
- Performed grounds maintenance around wells.
- Cleared downed trees blocking access to wells 18WW19, 18WW20 & 18CPTMW16.
- Completed semi-annual sampling.
- Repaired sprinkler heads on the North and West sprinkler lines.
- Re-developed monitoring wells 18CPTMW22SW, 18CPTMW03SW, 18CPTMW10DW, 18CPTMW08DW, 18CPTMW06, and 18CPTMW12DW.
- Developed wells 18WW25, 18CPTMW26, 18CPTMW19SW, 18CPTMW22R, 18CPTMW23SW 18CPTMW22DW, and 18CPTMW26SW.
- Performed clearing operations around perimeter wells.
- Cleaned and adjusted level probes on ICT's 12D and 14C.
- Installed new low level probe on ICT 13D, 14B, and 14E.
- Installed new mechanical flow meter on ICT 12B.

1.2.3.8 Miscellaneous Activities

- Performed housekeeping in GWTP office, GWTP Shop, containment area and Army trailer.
- Performed mowing operations around GWTP, Army trailer, decon pad, connexes, around all directional signs and around TK-700, pump house & extraction wells at LHAAP-16.
- Installed "Concealed Guns Prohibited" & "Open Carry Prohibited" signs on the entrance gate.
- Installed new blades and deck wheels on lawn mower.
- Performed grounds maintenance around wells at LHAAP-50.
- Collected quarterly sample from 35AWW13 at LHAAP-02.
- Completed semi-annual sampling at LHAAP-50.
- Developed monitoring well 67WW16 and 67WW15 at LHAAP-67.
- Completed semi-annual sampling at LHAAP-67.
- Collected quarterly surface water samples.
- Collected annual perimeter well samples.
- Staged one rolloff bin at LHAAP-37 and one rolloff bin at LHAAP-18/24.
- Cleared brush and trees at new well locations at LHAAP-37 and LHAAP-67.

1.2.4 Routine Maintenance at LHAAP-16

- Checked site on a daily basis.
- Collected monthly groundwater levels in all wells.
- Performed mowing operations around TK-700.

1.2.5 Routine Maintenance (Potable Water Wells)

- Flushed potable water lines.

1.3 Filter Cake Operations and Management

- No filter cake operations were performed during this period.

1.4 Fluidized Bed Reactor Operations

The FBR operated well during this reporting period. However, several samples exceeded the discharge criteria throughout April 2016 and on two occasions in May 2016. These high concentrations are primarily associated with failure of the nutrient feed pump (P-103) in the FBR. The pump was removed on April 5, 2016 and a temporary pump was used until a new unit was installed on April 19, 2016. The oxidation reduction potential ranged between -393 and -460 mV, ammonia-nitrogen concentrations ranged between 0.919 mg/L and 13.5 mg/L, ortho-phosphorous concentrations ranged between <0.05 mg/L and 3.19 mg/L, and total organic compound concentrations ranged between 15.9 mg/L and 66.3 mg/L. No release of treated groundwater occurred during the reporting period.

The average perchlorate concentration in the GWTP influent during the 2nd quarter 2016 was 11,650 µg/L.

1.5 Process Chemical Usage at GWTP

Approximate chemical consumption and the quantity delivered are shown on **Table 1-1**.

Table 1-1: Process Chemicals Delivered and Used

Chemical	Usage 2nd Quarter 2016	Quantity Delivered 2nd Quarter 2016
Hydrochloric acid	1,200 gallons	0
Sodium hydroxide (35%)	1,450 gallons	3,500 gallons
Acetic acid (50%)	825 gallons	1,100 gallons
Phosphoric acid (75%)	21.8 liters	0
Magnesium hydroxide	650 gallons	0
Urea	161.9 lbs	500 lbs
Polymer (magnafloc 110-L)	24.5 liters	0

Note(s):
L – liters

lbs - pounds

2 EVALUATION OF LHAAP-18/24 ICT EFFECTIVENESS

The ICT system at Burning Ground No. 3 is composed of 14 sections ranging in length from 100 feet to 1,300 feet. A total of approximately 5,000 linear feet of trench were installed within and around three sides of Burning Ground No. 3. The trench sections extend approximately 22 to 45 feet below ground surface (bgs). The majority but not all of the trenches are as deep as the confining clay layer of the shallow groundwater zone. High density polyethylene (HDPE) liners were installed in ICTs 12 and 13 located on the western and northern boundaries of LHAAP-18/24, respectively. The location of the liners is shown on **Figure A-1** in **Appendix A**. **Table A-1** in **Appendix A** presents the depths of the ICTs.

2.1 Sampling Activities

No ICT sumps were sampled during the 2nd quarter 2016. Monitoring wells were sampled during this reporting quarter. The results are presented in **Section 4**.

2.2 Performance of Plume Capture

The intent of the ICTs is to control groundwater gradients, prevent off-site migration of contaminated groundwater, and to extract highly contaminated groundwater and reduce the mass of contaminants in groundwater. Liners were installed in the ICTs on the northern (ICT 13) and western (ICT 12) site boundaries to limit migration of contaminated water from the site towards Harrison Bayou. At the same time, the liners reduce and prevent removal of contaminated groundwater that is outside the containment zone, between the site and Harrison Bayou. The ICTs are installed within the shallow formation at the site and capture primarily shallow groundwater zone (e.g., < 40 feet below ground surface).

In 2007 and 2008, in consultation with TCEQ/USEPA, the Army ceased operations of ICTs 1, 3, 5, 10, and 12A for groundwater extraction (note that extraction from ICT 12A was resumed after pump replacement in December 2012). Two other ICTs (ICT 6 and ICT 9) were changed from extraction ICTs to re-injection ICTs. **Table B-1** in **Appendix B** presents a summary of extraction equipment replacement since 2011 as dictated by poor extraction performance (malfunctioning pumps, poor pump positioning with respect to groundwater, non-operational level probes, scale build up, etc.). Further discussions of the extraction performance of various ICTs and extraction wells are presented in **Section 2.3**.

Potentiometric surface maps for the Shallow Zone in the vicinity of LHAAP-18/24 were developed based on depth to groundwater levels measured in April 8, May 13, and June 9, 2016. The corresponding groundwater surface elevations are shown on **Figures B-1, B-2, and B-3 in Appendix B**, respectively.

The potentiometric surface maps for April, May, and June 2016 continue to reflect the presence of a Shallow Zone groundwater high in the northern/northwestern portion of the site, with groundwater flowing radially from the highest point at monitor well 123, inside the containment. Rainfall amounts recorded at the GWTP were 8.47 inches in April 2016, 1.92 inches in May 2016, and 4.71 inches in June 2016. The anomalously high rainfall in April 2016 resulted in increased groundwater elevations across the LHAAP-18/24 site, especially in the northern/northwestern area of the site.

During the reporting period, treated groundwater was returned to LHAAP-18/24 with no discharge to Harrison Bayou or the INF pond. Approximately 2,833,000 gallons of treated water were returned to LHAAP-18/24 through the irrigation system.

The average daily extraction rates from the ICTs were approximately 43,000 gallons per day (gpd) in April, approximately 35,000 gpd in May, and approximately 37,000 gpd in June. Due to the increase in groundwater elevation at the site and the operation of all ICTs, the volume of overall extracted groundwater averaged more in the 2nd quarter compared to the 1st quarter.

Groundwater levels in the Wilcox Formation (generally occurring below 40 to 50 feet below ground surface) were measured during the 2nd quarter 2016 gauging events. Wilcox Formation wells correspond generally with those wells previously identified as "Intermediate" and "Deep" wells. "Intermediate" wells are designated as Upper Wilcox Formation wells and "Deep" wells are designated as Lower Wilcox Formation wells. Generally, the Upper and Lower Wilcox Formation wells are in communication and can be mapped as a single hydraulic unit. The Upper Wilcox groundwater elevations are used for contouring the potentiometric surface of the Wilcox Formation. **Figures B-4, B-5, and B-6** of **Appendix B** identify the Wilcox Formation monitoring wells and the potentiometric surfaces developed from the April, May, and June 2016 water level gauging events, respectively. There is a groundwater high on the Wilcox Formation potentiometric surface in the vicinity of MW-14 that in near, but slightly west of the location of the Shallow Zone groundwater high. Wilcox Formation groundwater flows radially off of the groundwater high in the vicinity of MW-14 to the northeast, northwest, and southwest in the directions of Harrison Bayou, Saunders Branch, and Caddo Lake. Similar to shallow groundwater, the groundwater levels in the Wilcox Formation remained stable between April and June 2016.

Compliance sampling was conducted between June 7 and June 29, 2016. Groundwater chemicals of concern (CoC) maps depicting the results of the June 2016 groundwater sampling event for perchlorate, trichloroethene (TCE), and methylene chloride (MC) are presented as figures in **Appendix C**. The time series plots of CoC concentrations from various monitoring wells are included in **Appendix D**.

The highest perchlorate concentrations in the shallow zone are observed in 120, MW-7, MW-5, MW-21, MW-23, MW-1, MW-3, and 18WW17 with concentrations in these wells ranging between 14,800 mg/L and 82,900 µg/L (**Figure C-1**). Perchlorate in groundwater has migrated off-site in all directions. The perchlorate concentration in 18CPTMW23 was reported at 2,310 mg/L in June 2016 after a concentration of 456 mg/L was reported in December 2015. This well has a history of order of magnitude fluctuations in perchlorate concentrations. For example, a two orders of magnitude increase was observed between December 2014 and June 2015, a four orders of magnitude decrease was observed between June 2014 and December 2014, a four orders of magnitude increase was observed between December 2013 and June 2014, and a four fold decrease was observed between May 2013 and December 2013. These changes in concentration are likely influenced by to groundwater level fluctuations, rain amounts, and performance of the ICTs.

Perchlorate in the Wilcox Formation was detected in monitoring well 18CPTMW08SW at a concentration of 35,000 µg/L (**Figure C-2**), which is in the same order of magnitude as the concentration reported in December 2015 of 41,800 and June 2015 of 43,800 µg/L. Perchlorate

concentration decreases rapidly away from this well. Another area where perchlorate in the Wilcox Formation was identified at a very high concentration is in MW-14(B), with a reported concentration of 229,000 mg/L. Six new Wilcox wells were installed and sampled during the 2nd quarter 2016; 18CPTMW19SW, 18CPTMW22DW, 18CPTMW23SW, 18CPTMW26, 18CPTMW26SW and 18WW25 with reported perchlorate concentrations of 1.25, 0.917, 0.407, NS (dry), 6.42 and 0.2 µg/L, respectively. **Figure C-2** presents the concentrations of perchlorate in the Wilcox Formation.

TCE concentrations in the shallow zone remained consistent with the concentrations reported in December 2015 with the highest TCE concentration in June 2016 occurring in well 120 at a concentration of 17,100 mg/L decreased slightly from a concentration of 17,200 mg/L in December 2015 (**Figure C-3**). The greatest increase of TCE in the shallow zone occurred in 123 with a concentration of 80.1 µg/L in June 2016 compared to 0.5 µg/L in December 2015. This increase is likely due to fluctuations in groundwater elevations and rainfall amounts. The greatest decrease in TCE in the shallow zone occurred in MW12 with a reported concentration of 294 µg/L in June 2016 compared to 2000 µg/L in December 2015. This is attributed to increased ICT extraction during the 2nd quarter 2016 compared to intermittent ICT extraction during the 4th quarter 2015. The trend of TCE concentrations is such that the highest concentrations occur within the containment area and decrease moving outwardly (**Figure C-3**).

TCE in the Wilcox Formation is present at low concentrations with the highest concentration of 15,900 mg/L identified in MW-14. This concentration has increased slightly from a concentration of 15,500 mg/L in December 2015. A concentration of 46.5 µg/L was reported in 18CPTMW01SW in June 2016. This is a sharp decrease from 368 µg/L in December 2015 but is similar to the decrease from 1,210 µg/L identified in 18CPTMW01SW in December 2014 to a concentration of 473 mg/L in June 2015 (**Figure C-4**). The concentration of TCE in the Wilcox Formation in the vicinity of 18CPTMW03SW at 153µg/L in June 2016 decreased from 561 mg/L in June 2015. No detections of TCE were observed in new wells 18CPTMW19SW, 18CPTMW22DW, 18CPTMW23SW, 18CPTMW26SW or 18WW25.

The concentrations of MC in the shallow zone remains centered on MW-2 with a concentration of 21,300µg/L measured in June 2016 which is significantly less than the concentration of 130,000 µg/L reported in June 2015. Methylene chloride in the shallow formation extent is depicted on **Figure C-5**.

MC in the Wilcox Formation is present at a concentration of 746 µg/L identified in 18CPTMW01SW which is lower than concentration reported in December 2015 of 5,900 µg/L. MC was also detected in MW-14 with a concentration of 53.5 mg/L. Methylene chloride in the Wilcox Formation extent is depicted on **Figure C-6**.

Time-series graphs for the shallow zone and Wilcox Formation wells are presented in **Appendix D**. Graphs for shallow zone wells C8, MW-02, MW-07, MW-08, MW-16, MW-17, MW-20, MW-21, MW-22, MW-23, 18WW08, 18WW10, 109, 120, 126, 129, AWD-1, and AWD-3 are included. Graphs for Wilcox wells C3, C4, MW-14, and 18WW09 are also included. The following observations were made, based on the June 2016 groundwater monitoring results:

- Concentrations of perchlorate, TCE, and MC in MW-02, located inside the containment in the shallow zone, increased after an unexplained decrease in December 2015. Previous similar fluctuations in MC, TCE and perchlorate concentration have been observed.
- Concentrations of TCE, MC, and perchlorate in MW-22 inside the containment in the shallow zone remained similar to previous results. Perchlorate concentration in MW-23 decreased since December of 2015. Perchlorate concentration increased, but TCE concentrations decreased slightly in shallow zone monitoring well 120 inside the containment.
- MC remained below the detection limits in samples from C-08, to the northeast of the containment area. TCE decreased to 5.61 ug/L after a slight increase was observed during the December 2015 sampling event which was likely related to the limited groundwater extraction that occurred during the 4th quarter of 2015. The other two northeastern wells, MW-21 and 109, showed a significant decrease in TCE and perchlorate concentrations.
- Wells to the southwest of the containment area include MW-07, MW-08, MW-17, and 129. MW-07, which had a slight increase in perchlorate, a slight decrease in TCE, and were non-detect for MC. A decreasing perchlorate trend was observed in MW-08. The TCE concentrations in MW-08 also continued to decrease, along with low levels of MC that were below the maximum contaminant level (MCL). Perchlorate concentrations in MW-17 decreased to below the detection limit after an increase from a period of declining concentrations to 24.4µg/L during the December 2015 sampling event.
- CoC concentrations in samples from wells MW-16 and 18WW08 in the shallow zone to the northwest of the containment area were graphed. Concentrations of TCE in MW-16 increased in June 2016 compared to December 2015, remaining higher than typical historical levels. MC remained below the detection limit. Perchlorate concentrations decreased considerably from concentrations in December 2015. Concentrations of TCE, perchlorate and MC decreased in 18WW08 between December 2015 and June 2016. Decreasing concentrations in these wells likely reflects increased extraction from the ICTs after a period of partial extraction during the 4th quarter 2015.
- Wilcox well C-04 to the northeast of the containment area remained non-detect for TCE and MC. Perchlorate concentrations were below the detection limit in C-04 after a low concentration of 0.351µg/L was reported in December 2015. C-03, also located northeast of the containment area, remained non-detect for TCE and MC but showed a slight increase in perchlorate to 5.48µg/L after a reported concentration of 1.35µg/L in December 2015.
- Concentrations of TCE and perchlorate in Wilcox well MW-14 began increasing after May 2006, with most recent June 2016 concentrations of 15,900µg/L and 229,000µg/L, respectively. MC concentration decreased below the detection limit in June 2016. The concentrations of TCE in monitoring well 120 are similar to the concentrations observed in MW-14. These co-located wells are in an area where the Wilcox clay is absent, so the increase in TCE concentrations in MW-14 over time is probably attributable to natural vertical dispersion effects.

- Concentrations of TCE and MC in Wilcox well 18WW09 to the northwest of the site remained non-detect. Perchlorate decreased to below the detection limit after a reported concentration of 0.134µg/L in December 2015.

In general, other than the changes observed above in perchlorate and TCE concentrations, the CoC concentration trends indicate that the plumes are stable, suggesting that the extraction system is effective in containing the plumes. The exception is the generally higher concentrations of TCE and perchlorate in MW-16 compared to data collected prior to 2014. Discovery of CoCs in various new monitoring wells installed in the spring of 2013 and in 2014 is not an indication of plume expansion. The new data reflect existing conditions in areas that could not be assessed until the new monitoring wells were installed and sampled. Future changes in concentrations over time will allow identification of any CoC trends, if present.

2.3 Quantity of Water Extracted from LHAAP-18/24

The average daily extraction rates from the ICTs as measured by the sum of individual ICT flowmeters were approximately 43,200 gpd in April, approximately 35,000 gpd in May, and approximately 37,000 gpd in June 2016. The extraction rates were higher than the 1st quarter 2016 due primarily to operation of all ICTs in opposed to partial operation in January 2016 and significant cumulative rainfall throughout the quarter.

The volume of groundwater removed from LHAAP-18/24 and LHAAP-16 during the quarter was approximately 2,700,000 gallons based on total flow measured at the GWTP headwork through flowmeter FIT-140. **Figure 2-1** shows the historical trends of extracted volumes by quarter. After a historical low extraction volume in the 3rd quarter 2012 due to equipment malfunction, extraction rates were restored in the 4th quarter 2012 and remained at steady levels only influenced by formation limitations (i.e., rain-controlled flows) and occasional pump fouling. During the 4th quarter 2015 due to malfunction of the air stripper blower, partial groundwater extraction was implemented and the total volume extracted was low. In contrast to the volume above, the total estimated volume based on individual flow meter readings from LHAAP-18/24 and LHAAP-16 was approximately 3,735,000 gallons. The difference is approximately 32% with flow volumes measured at the headwork of the GWTP considered more representative of the extracted groundwater volume.

As indicated by **Table 2-1**, 24 ICTs (including vertical extraction wells EW-01 and 18WW17) out of 28 produced water during the current quarter, compared to 21 of 28 ICTs which produced water during the 1st quarter of 2016.

2.4 Groundwater Treatment Plant Sampling and Analysis

As part of the GWTP operations, samples from various water streams were collected and analyzed for the parameters cited in the Interim Record of Decision (ROD) and the TCEQ letter dated January 8, 2002. Besides the ROD sampling requirement, additional analyses were performed on the influent and effluent samples to monitor the effectiveness of the FBR process. **Sections 2.4.1** through **2.4.4** present the results of analyses conducted during the current quarter. The complete laboratory results are provided on a compact disk (CD) (**Appendix E**).

2.4.1 Perchlorate Sampling

Table 2-2 presents the perchlorate results for the 2nd quarter of 2016. The perchlorate concentrations in the effluent (TK650) were above the discharge criteria of 6 µg/L for daily average and 13 µg/L for daily maximum in several of the collected samples. 4 (four) samples did not meet the discharge limit in April with reported effluent concentrations of 810, 131, 174, and 36.1 µg/L respectively (note that discharge did not occur during the current quarter). Two samples also did not meet the discharge limit in May with reported effluent concentrations of 264 and 131 µg/L, respectively. The increase in perchlorate concentration was a result of low concentrations of nutrients, a condition which was corrected during the current quarter.

Three grab samples from the influent to the GWTP (Tank 140) were collected. The perchlorate concentrations in these samples were 9,850, 11,100, and 14,000µg/L.

2.4.2 VOC Sampling

Tables 2-3 through 2-5 present the effluent VOC results for April, May, and June 2016. Sampling of the effluent for VOCs was conducted on a biweekly basis, and the results, where applicable, were below the discharge limits. The results also provide monthly influent concentrations for VOCs and perchlorate.

2.4.3 Monthly Metals Sampling

As per the revised sampling and analysis plan (Shaw, 2007), the monthly metals sampling is reported in **Tables 2-3 through 2-5**. None of the metals exceeded the effluent discharge limits. Selenium reporting limit of 10 mg/L exceeded the daily average limit of 5.7 mg/L but was below the daily maximum concentration of 12 mg/L.

2.4.4 Quarterly Sampling

Sampling of the effluent for VOCs, anions, chemical oxygen demand (COD), oil and grease, perchlorate, and metals was conducted during this quarter and summarized in **Table 2-6**.

Notes:

No discharge to Harrison Bayou occurred unless perchlorate concentration was below detection

SP140 samples are influent samples

µg/L - micrograms per liter

DVQ - data validation qualifier

MAL - minimum analytical level

J - Estimated concentration

U - non detect

* - special intermittent grab sample

3 EVALUATION OF LHAAP-16 EXTRACTION SYSTEM

The extraction system at LHAAP-16 produced approximately 245,000 gallons of water in the 2nd quarter of 2016 based on the sum of individual well head flow meters. The volume extracted from LHAAP-16 during the 2nd quarter 2016 was higher than the typical average volume of groundwater extracted from this site due to high cumulative rainfall throughout the quarter. The reported volume is based on the sum of individual flow meter readings. The volume of extracted groundwater from LHAAP-16 is shown in **Figure ES-1**.

3.1 Quantity of Groundwater Extracted from LHAAP-16

The quantity of groundwater extracted on a monthly basis is presented on **Table 3-1**. These flows are based on the sum of individual flow meter readings.

3.2 Groundwater Elevation

The groundwater elevations in the piezometers and monitoring wells at LHAAP-16 for April, May, and June 2016 are presented on **Table 3-2**. The potentiometric surface maps for the shallow and Upper Wilcox (intermediate) groundwater zones at LHAAP-16 for April, May, and June 2016 are presented in **Figures B-7 through B-12** in **Appendix B**.

Table 3-1: Groundwater Extraction Quantities from LHAAP-16 (gallons)

Apr-16	May-16	Jun-16
79,945	77,470	93,633

4 GROUNDWATER MONITORING AT LHAAP-18/24

Water levels from 65 monitoring wells and 11 piezometers (piezometer 12 was damaged and plugged and abandoned in May 2013) are measured monthly to generate potentiometric surface maps that assist in monitoring the effectiveness of the groundwater extraction system on plume containment. The groundwater contours are generated using the water levels from the shallow zone and Wilcox Formation wells. The water level data are presented in **Table 4-1**. No re-injection of treated groundwater occurred during the 2nd quarter of 2016. Treated water was returned to LHAAP-18/24 grounds via the existing irrigation system (sprinkler heads) during the current quarter, with no discharge to Harrison Bayou occurring during the quarter. Potentiometric surface maps are presented in **Appendix B** and groundwater elevations from the 2nd quarter of 2016 are discussed in **Section 2.2**.

The ICT sumps and vertical extraction wells were not sampled during this quarter. Monitoring wells were sampled during the current quarter at LHAAP-18/24 and analytical results are shown in **Table 4-2**.

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Table 4-2: LHAAP-18/24 Semi-Annual Sampling Results - June 2016

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Table 4-2: LHAAP-18/24 Semi-Annual Sampling Results - June 2016

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Table 4-2: LHAAP-18/24 Semi-Annual Sampling Results - June 2016

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

Location IDs containing "F" indicate sample filtered in the field with 10 micron filter.

Location IDs containing "FD" indicate duplicate samples.

Location IDs containing "B" indicate sample taken at bottom of screened interval and "T" indicate sample taken at top of screened interval.

Blue Highlighting Indicates Analyte Detected Above MCL/PCL

Note: Some samples may have been diluted due to the concentration(s) of one or more analytes exceeding the upper limit of the calibration curve.

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

MCL - Maximum Contaminant Level

mg/L - milligrams per liter

NA - not analyzed

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

U - Undetected: The analyte was analyzed for, but not detected.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

ug/L - micrograms per liter

ug/L - micrograms per liter

5 QUALITY CONTROL

This report summarizes the data for samples collected during April, May, and June 2016. The samples were collected in accordance with the Sampling and Analysis Plan for the GWTP (USACE, July 2007) that treats water from LHAAP-18/24 and LHAAP-16. The purpose of the sampling program is to evaluate the effectiveness of the groundwater pump and treat system, assess water quality within the capture zone, and assure compliance with the effluent discharge requirements of the Interim ROD. Quality control and quality assurance problems noted in the case narratives received from the laboratory are minor and do not affect the usability of the data for compliance at the GWTP. No sample results from the 2nd quarter of 2016 were rejected due to quality control problems.

Microbac analyzed the compliance samples collected from the GWTP. Independent data verification and validation was performed by the AECOM project chemist. The laboratory reports for the 2nd quarter of 2016 are included in **Appendix E** on a CD.

6 TREATED GROUNDWATER USED FOR REINJECTION

Reinjection of groundwater in ICT 6 and ICT 9 was discontinued as of July 15, 2012. The last injection occurred on May 24, 2012, immediately prior to the scrubber system malfunction which caused GWTP operation to cease temporarily.

7 AIR MONITORING

7.1 Summary of Air Monitoring Approach

Operation of the GWTP without air abatement was approved by the TCEQ and USEPA conditioned on collection of air monitoring data to determine the effect on GWTP operation on ambient air quality with respect to potential human health exposure risk. An Interim Air Monitoring Plan was developed by AECOM in August 2012 and used to implement the air monitoring program. The air monitoring program included sampling emission concentrations from the air stripper, ambient air at the GWTP, and ambient air downwind of the GWTP. Collection of air data occurred on a weekly basis between September 2012 and September 2013, on a monthly basis between September 2013 and September 2014, and on a quarterly basis since that time. The sampling program includes use of Summa canisters and a photoionization detector (PID) to collect vapor phase concentrations. The air stripper emission sample is collected as a grab sample, while the ambient air samples are collected as composite samples. The GWTP sample is collected over 8 hours to represent a work day and the downwind sample is collected over 24 hours to represent potential exposure to an off-site receptor[1]. The downwind sample is collected at the closest downwind property boundary based on prevailing wind direction.

PID data (after system calibration) are collected each time the GWTP is operated and serves as a real-time indicator of ambient air conditions at the GWTP and downwind. Correlations between analytical air data and PID measurements were established and a means to calculate contaminant concentration from PID measurements was developed. A PID threshold of 0.4 parts per million by volume (ppmv) in ambient air was established, such that Summa canister measurements would take place when the PID threshold is exceeded.

The Summa canister samples are analyzed for VOCs using EPA Method TO-15. The PID results are collected after instrument calibration. The air sampling results are summarized and any exceedances communicated to the USEPA and TCEQ within the first 2 weeks of the ensuing month after air samples were collected using unvalidated sampling data in order to shorten the lead time between sampling and reporting to the agencies. The information includes a summary of analytical results (when collected) and PID readings, calculations of emission rates from the emission point, comparison of ambient air concentrations with TCEQ Air Monitoring Comparison Values (AMCVs) or the short-term Effects Screening Levels (ESLs) for chemicals with no published AMCVs, and a compilation of PID results and calibration records. The air monitoring results to date indicate that all ambient air concentrations are lower than the AMCVs or ESLs. The stripper stack sample concentrations are used to calculate emission rates in pounds per hour (lbs/hr) and tons per year (tpy). The calculated emission rates in lbs/hr are then compared to the allowable emission rates per 30 Texas Administrative Code (TAC)

[1] Off-site receptor--Any recreational area, residence, commercial/industrial facility, or other normally occupied structures not used solely by the owner or operator of the facilities or the owner of the site upon which the facilities are located. Measurements of distances to determine compliance with this distance restriction must be taken toward structures that are in use as of the date that a notification is filed with the commission.

106.533(f)(1). All emission rates have been lower than the allowable emission rates to the conservatively-selected off-site receptor[1]. The calculated emission rate in tpy is compared to the allowable limit of 5 tpy per chemical. All emission rates have been lower than the allowable emission rates.

The air monitoring results from the first few months of operation between September and November 2012 were compiled and submitted in a separate report (December 2012, along with validated data) to TCEQ to demonstrate compliance with Texas Permit By Rule emission standards. Approval of the analytical results and concurrence that the site will continue to meet Title 30 TAC §106.533 without the use of air abatement using a catalytic oxidation system was obtained from the TCEQ via email on February 22, 2013.

On February 18, 2013, AECOM presented analysis of the approach applicable to obtaining a variance for operating the GWTP without air abatement equipment to the TCEQ and EPA. The analysis indicated that the use of Explanation of Significant Difference (ESD) is the appropriate approach for the site. Approval of use of ESD was obtained from the EPA via email on March 21, 2013. The ESD was developed, reviewed, and accepted by EPA and TCEQ. The ESD was signed by the designated parties on April 3, 2014 and concurrence from the TCEQ was obtained in a letter dated April 16, 2014.

7.2 Air Monitoring Results for the 2nd Quarter 2016

A summary of the air sampling results is presented in **Appendix F**. Air samples during the 2nd quarter were collected on May 23, 2016. All results met the criteria described in **Section 7.1**.

7.2.1 Summa Canister Monitoring Results

One sampling event was conducted during the 2nd quarter 2016 using Summa canisters. The samples were collected and analyzed as described in **Section 7.1** and per the approved air monitoring plan dated August 2012. The analytical results were then compiled in spreadsheets where calculations were completed and comparisons to applicable criteria were made as described in **Section 7.1**.

7.2.1.1 Ambient Air Results

Acetone, acetonitrile, benzene, 2-butanone, carbon disulfide, 4-methyl-2-pentanone, ethanol, ethyl acetate, ethylbenzene, d-limonene, methylene chloride, trichloroethene, n-hexane, n-heptane, naphthalene, n-nonane, alpha-pinene, tetrahydrofuran, toluene, dichlorodifluoromethane, trichlorofluoromethane, trichlorotrifluoroethane, 1,2,4-trimethylbenzene, m,p-xylenes, and o-xylene were detected in May 2016 in ambient air downwind of the GWTP.

Compounds originating at the GWTP would be expected to have lower concentrations in the downwind sampling location than at the GWTP sampling location. Likewise, compounds like benzene and trichlorofluoromethane with similar concentrations in both GWTP ambient air and downwind ambient air are suspected to be present in the ambient (background) air. Outside sources of contamination are indicated by compounds such as alpha-Pinene that are not present at the GWTP or compounds with ambient air concentrations lower than the downwind concentrations.

All ambient air results during the quarter met the ambient air criteria.

7.2.1.2 Air Stripper Effluent Results

The VOCs present in groundwater that are removed via the air stripper include 1,1-dichloroethene, 1,2-dichloroethane, cis-1,2-dichloroethene, methylene chloride, tetrachloroethene, trichloroethene, and trichlorotrifluoroethane. The highest reported concentrations are for cis-1,2-dichloroethene, methylene chloride, trichloroethene, and trichlorotrifluoroethane. These compounds are frequently reported in groundwater at the site, with the exception of trichlorotrifluoroethane which is not typically a groundwater analyte at Longhorn. Trichlorotrifluoroethane, however, appears to be present in groundwater as indicated by limited analysis conducted in December 2013, where it was detected in several wells, and from historical accounts. Many of the chemicals that are reported in ambient air are not detected in the air stripper effluent. This is likely because the reporting limit for the air stripper effluent is higher than the reporting limit for the ambient air samples or the source for some of these chemicals are extraneous to groundwater.

All air stripper effluent concentrations were below the emission criteria.

7.2.2 PID Results

Along with collection of Summa canister air samples, PID measurements from the same sources/areas are collected and recorded. These simultaneous measurements allowed establishing a correlation between PID readings and VOC concentrations in the Summa canister air samples. Conversion from PID to compound concentrations was established by TCEQ in 30 TAC §106.533(h). The TCEQ equation allows use of a PID to determine individual compound concentrations if the distribution of chemicals in the ambient air is known or assumed. This allows the use of a PID as a tool to measure VOC concentrations and convert the PID results to estimates of compound concentrations. All ambient air PID measurements during this quarter at the GWTP were reported at 0.0 ppmv. The results of the PID readings collected during GWTP operations are presented in **Appendix F**.

8 COMMENTS AND RESPONSES

Comments were received from the TCEQ on the 1st 2016 Quarterly Report via email dated December 21, 2016.

TCEQ Comments on the 1st Quarter 2016 Report

1. *TCEQ is concerned with the levels of perchlorate remaining in some of the treated water reapplied to the site through irrigation. TCEQ is also concerned with the use of extended irrigation as standard practice at 18/24. In particular, the January 19 and 25 sample results show 3,980 and 3,530 micrograms/liter. Applying such contaminated water back to the site is not consistent with the intended use of irrigation. Irrigation is intended to allow plant operation during times of low flow in Harrison Bayou. Furthermore, looking back to the 2005 approval of irrigation, the INF pond should also be used as part of the complete treatment and holding system. Irrigation was intended for use during dry months when the INF pond was full. This seasonal use has expanded through time to use almost all year. The year round use is because the system often isn't able to meet effluent limits. Irrigation approval was originally based on seasonal lack of flow in Harrison Bayou. Use of the INF pond as a holding tank has been discontinued but additional effluent holding capacity, and possible recirculation through treatment system, should be part of the strategy to allow more discharge to Harrison Bayou.*

Response: Concur. The report has been edited to reflect the order of preference for GWTP effluent discharge: Harrison Bayou (if flowing), INF Pond (if no flow in Harrison Bayou), and irrigation onto LHAAP-18/24 (if INF Pond is full).

EPA Comments on the 1st Quarter 2016 Report via email dated December 21, 2016.

1. *EPA concurs with the comment above from TCEQ. EPA also would add that the site be monitored more closely for runoff during irrigation per the August 2005 Memo from William Corrigan to Rose Zeiler.*

Response: Concur. AECOM is putting the following steps in place to eliminate run-off. While irrigating, site inspections will be performed to ensure pooling and runoff are not occurring. During the irrigation activities, inspections will be performed twice a day and documented in an inspection log. If ponding or runoff is observed, irrigation at that sprinkler line will cease, and irrigation at another sprinkler line will be started if possible. There are three main sprinkler lines. To avoid pooling and runoff of irrigation water, only one line will be used for half a day at a time, with a separate line being used the second half of the day. The three lines will be used in an alternating fashion five days a week, with only one line at a time used for a maximum of half a day at a time. The irrigation will occur 5 days a week for 8 hours each day (using 3 sprinklers in each line). If conditions are wet due to rain events, irrigation will not be conducted to avoid ponding and potential runoff.

APPENDIX A: ICT Layout & GWTP Process Flow Diagram

Table A-1: ICTs Completion Depths

ICT	TOC Elevation	Total Depth	Sump Elevation	Comment
1	186.07	22.5	163.57	Taken out of service in 2007
2	185.02	29.5	155.52	
3	192.27	37.75	154.52	Taken out of service in 2007

14C	197.86	41.33	156.53	
14D	198.47	44.25	154.22	
14E	198.47	43.08	155.39	

Note(s):

Sump elevation calculated by subtracting total depth from TOC elevation.

ICTs were installed in 1998.

Elevations are reported as feet above mean sea level.

Total depths are reported as feet below TOC.

ICT interceptor collection trench

TOC top of casing, measuring point for groundwater elevations

TOC Elevations and total depth measured in October 2003, 4th Quarter 2003, GWTP Report.

ICT 12A was replaced on December 5,2012 and extraction has resumed.
