

Subject: Final Minutes, Quarterly Restoration Advisory Board (RAB) Meeting Longhorn Army Ammunition Plant (LHAAP) Location of Meeting: Karnack Community Center, Karnack, Texas Date of Meeting: July 19, 2018, 6:00-7:15 PM Central Daylight Time (CDT)

#### Meeting Participants:

Army BRAC:	Rose M. Zeiler and Tom Lederle
USACE:	Aaron Williams
USAEC:	Nicholas Smith
Bhate:	Kim Nemmers
APTIM:	William (Bill) Foss
USEPA Region 6:	Rich Mayer, Dorelle Harrison
TCEQ:	April Palmie
RAB:	Present: Paul Fortune, Judy VanDeventer, Tom Walker, and Richard Le
	Tourneau
	Absent: Carol Fortune; Charles Dixon; Terry Britt; John Pollard, Jr.; and
	Nigel R. Shivers
Public:	Laura-Ashley Overdyke, Kathy and Calvin Witt, Beth and Mark Hammett
	Daren Horton, and Hattie Hackler

An agenda for the RAB meeting, a color copy of the Bhate Environmental Associates, Inc. (Bhate) slide presentation, and handouts (see list at end of meeting minutes) were provided for meeting attendees.

#### Welcome and Introduction

Mr. Paul Fortune, RAB Co-Chair, called the RAB meeting to order at 6:05 pm CDT. Mr. Fortune welcomed everyone. Mr. Calvin Witt and his wife Kathy, Mark and Beth Hammett, and Tom Lederle were welcomed.

Mr. Fortune also noted that Mr. Tom Lederle, who is with the U.S. Army and visits the RAB from time to time, was present. Mr. Lederle stated that he has visited annually since approximately 2001 and has had a relatively long involvement at Longhorn AAP. Mr. Lederle, who is chief of the Army BRAC Division, stated that he tries to visit at least one a year. Mr. Lederle explained that the Base Realignment and Closure (BRAC) process for installations began in 1988 with realignment and/or closure.

#### **Open Items**

Rose M. Zeiler, Longhorn Site Manager, explained that the purpose of the RAB meetings is to promote community awareness and obtain constructive community review and comments on environmental restoration activities at the former LHAAP. Ms. Zeiler explained that the RAB meetings are held every three months. Ms. Zeiler stated that the RAB members are a liaison from the Army to the community and noted that applications to become a RAB member are available on the Longhorn Army Ammunition Plant (LHAAP) website. Ms. Zeiler explained that

handouts from the meeting and the Administrative Record are also present on the LHAAP website.

Ms. Zeiler noted that the RAB meeting minutes had been sent out in May 2018. Ms. Judy VanDeventer made a motion to approve the April 2018 RAB Meeting minutes. Mr. Richard Le Tourneau seconded the motion.

Mr. Darren Horton of Caddo Lake asked how many RAB members are currently active and how many are allowed. Mr. Horton also asked if there are RAB member openings. Ms. Zeiler stated that there are currently 9 members and that we have had no reason to limit the number of RAB members. Mr. Fortune stated that new members are always welcome.

#### **Defense Environmental Restoration**

#### Overview of Hydrology

Ms. Zeiler explained that due to prior meeting questions, Bhate is presenting information about how groundwater and plumes move. Mr. Bill Foss explained which sites are covered under the Bhate contract. Ms. Zeiler noted that several sites are not under Bhate's contract and these do not have Records of Decision (RODs) yet. Mr. Foss provided an explanation of hydrogeology, the terms used, how an aquifer works, and how a plume moves. Mr. Foss explained that soils are made up of different size grains. The larger the grain size, the easier for groundwater to move within the soils. Mr. Foss explained hydrology terms first. Aquifer is a water bearing layer that produces water in usable quantities. Permeability is how fast something can flow through the material (e.g. gravel has a higher permeability than a clay). Aquitards are lower permeability layers such as a clay, shale or siltstone. Potentiometric surface is the top elevation of the water table measured in monitoring wells and the groundwater elevations in the potentiometric surface are used to determine the groundwater flow direction. A plume is a body of fluid that doesn't belong (has a different chemistry) in the groundwater. DNAPL is an acronym for free product or dense non-aqueous phase liquid, which is a very high concentration of a chemical that has not dissolved, is more dense than water, and is sitting on the bottom of the aquifer. DNAPL may follow a different flow direction than the overall groundwater flow since it sits on the bottom and flows in direction of the bottom of the aquifer. Hydrogeology is distinct from geology because it is the study of groundwater flow through soils and not just soils. Vadose zone soils do not have any groundwater present. Mr. Foss then explained how the different groundwater and soil zones interlace and how a plume might move through an aquifer. Mr. Foss explained that you can have contamination move with the groundwater in a dissolved phase plume, but you can also have contamination stay behind (e.g. DNAPL that sinks). The residual contamination is considered the "source material" because it feeds the dissolved phase plume. Mr. Foss noted that the dissolved phase plume can be very low concentrations. The goal of remediation is typically to remediate both the source material and the dissolved phase plume.

#### Site LHAAP-0003

#### Longhorn Army Ammunition Plant Restoration Advisory Board 3rd Quarter 2018 Meeting

Mr. Foss explained that the ROD for LHAAP-03 has been finalized and is awaiting Regulatory signature and concurrence. The remedy has been selected (excavation of soils contaminated with arsenic and lead to prevent leaching to groundwater) and the remedial design will be prepared in the coming months. Mr. Foss explained that LHAAP-03 is a site where the focus is on soils only. The site stored paint shop wastes, including primers containing heavy metals and solvents. The groundwater is being managed under Site LHAAP-58, which is a much larger site in which LHAAP-03 is a small part. LHAAP-03 groundwater is being addressed under Site LHAAP-58 and this is being formally documented via an Explanation of Significant Difference (ESD). Mr. Foss explained that the contaminants of concern are arsenic and lead in soils and that the depth to groundwater is 12 to 16 feet below ground surface (bgs). The groundwater at Site LHAAP-03 is indistinguishable from LHAAP-58. Mr. Foss explained that the contaminated soil will be excavated and disposed of at a properly licensed landfill. Mr. Foss explained that most of the excavation is approximately 2 feet bgs, but there are a couple of deeper areas (approximately 7 feet bgs). The excavation area is approximately 25 feet by 30 feet in area. Mr. Foss explained that additional sampling will be completed to further refine the area of excavation and then a Remedial Design and Remedial Action Work Plan will be prepared. Once the excavation is completed, then a Remedial Action Completion Report (RACR) will be prepared to document the removal action and associated sampling results and other activities.

Mr. Horton asked where the excavated soil goes when it is removed. Mr. Foss explained that the soil will be disposed at a non-hazardous landfill where the soil will likely be used as cover by the landfill to keep odors down. The type of landfill will be determined based upon the waste characterization.

Mr. Fortune asked if the painters were dumping waste, which created this issue. Mr. Foss stated that the area was a waste storage pad and that some of the best practices used today such as secondary containment and keeping containers in a covered area were perhaps not used back then. Mr. Foss stated that spillage and overflow are most likely causes of the contamination and not dumping. Mr. Horton then clarified that this was not a typical LHAAP munitions production site to which Ms. Zeiler concurred.

Mr. Fortune then asked if the former gas station within the maintenance complex had been remediated. Ms. Zeiler stated that a gas station in the LHAAP-58 area had been remediated.

Mr. Le Tourneau asked how many different classes of waste have gone offsite (e.g. Class 1, Class 2 and Class 3). Ms. Zeiler stated that most of the waste goes off as special, non-hazardous waste. Ms. Zeiler stated that some waste has been disposed of as hazardous waste and then explained that a rule called the "mixture rule" had changed such that waste from the filter press at the groundwater treatment plant is now being disposed of as special waste. Waste characterization was then discussed including evaluating for ignitability, toxicity, flashpoint etc. Ms. Zeiler explained that special waste is a term for waste that is non-hazardous but has some known contaminants present. Ms. Nemmers stated that there are two codes for non-

#### Longhorn Army Ammunition Plant Restoration Advisory Board 3rd Quarter 2018 Meeting

hazardous wastes in Texas. Ms. Overdyke asked if at this stage in the cleanup if more special waste is being disposed of compared to more hazardous waste earlier on in the remediation process. Ms. Zeiler stated that large amounts of soil have been disposed as special waste at LHAAP. Mr. Le Tourneau then asked about the rule change and what distance waste is now being transported for disposal. Mr. Foss stated that most hazardous waste disposed of during remediation is due to a characteristic of a high contamination present. Mr. Foss stated that waste is rarely disposed of due to ignitability or some of the other characteristics. Ms. Nemmers stated that all of the waste currently being disposed of from LHAAP is going off as special waste, but that the waste streams are tested just to make sure that the water is properly disposed. Ms. Nemmers explained that the waste streams are re-tested annually or when a new waste stream is generated. Mr. Foss stated that hazardous waste may have to go a longer distance to find a licensed facility, but that non-hazardous waste typically is transported to a nearby landfill. Ms. Zeiler stated that some waste from Site LHAAP-18/24 may have gone to a hazardous waste landfill though most of the soils that were removed years ago were thermally treated onsite and placed back onto the site. Mr. Richard Mayer stated that it is unlikely that the soils from Site LHAAP-03 will be hazardous waste given the low level detections of the metals. Mr. Fortune asked where a leaking gasoline tank waste would go. Mr. Mayer stated that testing would be completed to determine where and how to dispose of the waste. Ms. April Palmie stated that the waste would probably go to either a Class I or Class II landfill as non-hazardous characterized waste. Mr. Fortune asked where the soils would go if the gasoline was leaded. Mr. Foss and Mr. Mayer stated that it was possible that the waste could be hazardous due to concentration of benzene or lead. Ms. Zeiler then explained that petroleum sites fall under a different regulatory program.

#### **Overview of Sites**

Ms. Nemmers explained the document process under Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Ms. Nemmers explained that the sites managed under the Bhate contract already have a Record of Decision (ROD) in place and that Aaron Williams would be discussing the three sites that do not currently have a ROD later on. Ms. Nemmers explained that an ESD is used when minor changes to the ROD are needed to adjust the remedy selected but that many of the LHAAP RODs have contingency remedies. Ms. Nemmers then explained that once the remedy is implemented, the monitoring or what we call Remedial Action – Operations is completed to evaluate the remedy. Ms. Nemmers explained that most of the sites at LHAAP are in the Remedial Design or later states. Ms. Nemmers explained that many of the RODs for LHAAP have a contingent remedy as part of the foresight for the site.

Ms. Nemmers explained that LHAAP-16 and LHAAP-17 have remedial designs being developed. Ms. Nemmers stated that the injections were completed at LHAAP-58 and that a Remedial Action Completion Report (RACR) was prepared to document implementation of the remedy. The groundwater treatment plant (GWTP) regularly has quarterly reports prepared.

Longhorn Army Ammunition Plant Restoration Advisory Board 3rd Quarter 2018 Meeting

Ms. Nemmers explained that field work started at LHAAP-16 and LHAAP-17 was completed to move forward with the remedies. The wet weather conditions previously have not allowed all of the field work to be completed. However, the areas have dried up and the work will be completed soon. LHAAP-16 requires additional groundwater sampling and installation of injection wells in an area that was not previously accessible. LHAAP-17 requires surface soil samples to be collected in area that is often wet so the samples could not be collected. Ms. Nemmers stated that these additional soil samples will be used to further define the excavation area.

Ms. Nemmers explained that the LHAAP-58 groundwater sampling that was just completed will provide information about how the recent injections did to remediate the solvent plume. Ms. Nemmers then explained that the observed groundwater conditions at LHAAP-58 showed that the monitored wells received treatment. Ms. Nemmers explained that there were two different carbon substrates used at LHAAP-58. One part of LHAAP-58 was treated with sodium lactate (eastern plume) which has shown good results. Emulsified vegetable oil (EVO) was used in the other portion of the site. EVO typically lasts longer but takes a bit longer than sodium lactate to get working. Based upon the groundwater conditions observed, both injection areas look and smell like treatment is occurring. Ms. Nemmers explained that the groundwater was tested prior to the injections for microbes, and the necessary microbes are present naturally. Ms. Nemmers explained that this was good news even though additional microbes were added during the injections. Ms. Nemmers explained that using the two different carbon substrates will help to evaluate which eventually works best. Ms. Zeiler clarified that the eastern plume is continuing to remediate the solvents to which Ms. Nemmers concurred explaining that significant microbial growth has been observed. Ms. Nemmers explained that when microbial growth occurs that solvent concentrations decrease.

Ms. Nemmers then explained that the upcoming field work will lead to documentation that will be prepared in the next few months. This includes the reports for LHAAP-17 and LHAAP-16. Site LHAAP-58 will have quarterly sampling completed in the western plume where the injections were completed to evaluate the remedy. The other activities at LHAAP are ongoing.

#### Groundwater Treatment Plant

Ms. Nemmers discussed the handouts for the groundwater treatment plant (GWTP). Ms. Nemmers explained that the dry conditions have reduced what is being discharged at the GWTP from earlier in the quarter when the wet conditions allowed for discharge to the Harrison Bayou. Currently, the discharge is to the holding pond. Ms. Nemmers explained that maintenance is being planned for the perchlorate treatment system to improve the effectiveness. Ms. Nemmers explained that the treatment of groundwater is via a batch system using a holding tank to store extracted groundwater from LHAAP-18/24 and to a lesser extent from LHAAP-16 that is then treated by the system. Use of the holding tank allows for continued pumping of the extraction wells even if maintenance is occurring at the GWTP. Ms. Nemmers

explained that the purpose of the treatment system is to control the plume at LHAAP-18/24 and not necessarily remediate the plume. Ms. Nemmers stated that pump and treat takes a much longer time to remediate a site than in situ technologies. Ms. Nemmers explained that extraction also increases with precipitation due to percolation from the ground surface. Ms. Zeiler explained that a ROD is being prepared to further address LHAAP-18/24.

#### Surface Water Sampling

Ms. Nemmers explained that no surface water was sampled in June 2018 due to dry conditions. Ms. Laura-Ashley Overdike asked if there is any plan to adjust the sampling during a quarter for when there is flow in the creeks. Ms. Palmie explained that no sample is not necessarily bad since the sample is collected to assess whether groundwater is entering the surface water. If the bayou is dry, then groundwater is not discharging into the surface. Ms. Palmie explained that the chart with the discharge information is interesting because it tells whether the GWTP is operating properly, if the bayou is flowing and how much moisture is in the ground so it is hard to really draw conclusions with the information. Ms. Overdike asked what conclusions could be drawn from the chart showing the perchlorate detections in the surface water. Ms. Palmie explained that the spike shown on the figure was not an exceedance because the discharge criteria was higher when the detection occurred.

#### Site LHAAP-18/24, LHAAP-29 and LHAAP-47

Mr. Aaron Williams explained that HDR is completing work on the sites that don't have a ROD, which are sites LHAAP-18/24, LHAAP-29 and LHAAP-47. For Sites LHAAP-18 and LHAAP-29, Mr. Williams explained that the proposed plan (PP) is being prepared and then there will be a public comment period along with a public meeting. The Feasibility Study (FS) from January 2017 is the basis of the PP for Site LHAAP-18/24.

Mr. Williams explained that Site LHAAP-47 had a PP prepared but the site was impacted by the 2013 dispute which ended in 2016. So the site got held up and now the Army is re-evaluating the site. Mr. Williams explained that the last sampling completed at LHAAP-47 was in 2010 and now it is 2018. Ms. Zeiler stated that there were ten (10) dry wells present in 2010. Mr. Williams explained that the first step was to evaluate the wells and determine if they are still dry. If those wells were still dry, then the wells will be replaced. Mr. Williams explained that the first step us to evaluate the planned remedy was shown as in situ injections at MW-25 where trichloroethylene (TCE) was detected at 13,000 and downgradient where elevated TCE was also present. The dashed line on the figure of the intermediate plume is where further plume definition is needed. Ms. Overdike clarified whether the slides were showing current data. Mr. Williams stated that the first two slides showed historical data. Ms. Zeiler explained that the contractor is currently in the field.

The dry wells are in a very shallow, thin sand lens. Mr. Williams explained that there is a steady decline in shallow groundwater elevations in the area, including LHAAP-46 to the north that Mr.

Foss discussed. Mr. Williams stated that the wells that were dry in 2010 are still dry today. Mr. Williams explained that when the contractor was using the DPT to collect samples that more than one sample was supposed to be collected but the first interval was dry so only one water sample was collected.

Ms. Overdike asked about the possible reason. Mr. Foss discussed the assessment that has been done on LHAAP-46 to the north of LHAAP-47. Mr. Foss explained that the reason for this decline may be due to decreases in past mounding from leaky water pipes from the production areas and/or drought but that the increase in precipitation does not seem to be eliminating the dry wells.

Mr. Williams explained that the purple marks are the wells being installed and sampled. Mr. Williams explained that there was a surprise detection in the intermediate aquifer, so more wells are being added and the remedy design may be adjusted.

Ms. Zeiler asked if the stream sampling had taken place. Mr. Williams explained that there were to be four stream samples collected. Ms. Overdike asked if the stream testing locations and results could be shared at the next meeting.

Mr. Fortune asked about whether part of the three-year dispute was regarding setting a precedence for all other cleanups under Superfund. Ms. Palmie explained that it is unusual for a state to have its own cleanup standards and that it is even more unusual that these standards were superseded by other standards. Ms. Palmie stated that while there are take aways that could maybe translate to other sites, the overall issue was unique to LHAAP. Ms. Zeiler explained that for certain contaminants and pathways, the USEPA didn't have standards so TCEQ standards were evaluated. Ms. Palmie explained that usually the EPA values are used and that TCEQ values usually don't supersede EPA values and that TCEQ values fill in the gaps.

#### Next RAB Meeting Schedule and Closing Remarks

Ms. Zeiler then discussed the next meeting. The next RAB meeting will be held on **October 18**, **2018**, with a **meeting starting at 6:00 pm CDT** at the Karnack Community Center.

#### Adjourn

Mr. Fortune motioned to adjourn. Ms. VanDeventer seconded the motion. Meeting adjourned 6:23 pm CDT.

#### **Abbreviations and Acronyms**

μg/L	micrograms per liter
CERCLA	Comprehensive Environmental
	Response, Compensation, and
	Liability Act of 1980
DERP	Defense Environmental Restoration
	Program
DNAPL	Dense non-aqueous phase liquid
ESD	Explanation of Significant Difference
ft bgs	feet below ground surface
GWTP	groundwater treatment plant
LHAAP	Longhorn Army Ammunition Plant
LNAPL	Light non-aqueous phase liquid
MNA	monitored natural attenuation
MW	monitoring well

PDI	Pre-Design Investigation
RAB	Restoration Advisory Board
RA-O	Remedial Action - Operation
RACR	Remedial Action Completion
	Report
RAWP	Remedial Action Work Plan
RD	Remedial Design
ROD	Record of Decision
VOCs	Volatile organic compounds

### **Purpose of the RAB Meeting**

- Held every three months
- The mission of the Longhorn Army Ammunition Plant (LHAAP) Restoration Advisory Board (RAB) is to promote community awareness and obtain constructive community review and comments on environmental restoration activities at the former LHAAP

## The Army Wants You to be Informed

 The Army is committed to protecting human health and the environment; key to that commitment is engaging the community and increasing public participation in environmental restoration at LHAAP

#### • You are encouraged to:

- Attend RAB Meetings and/or become a member of the RAB
- Visit the Longhorn environmental website at <u>www.longhornaap.com</u>
  - Website is regularly updated to indicate the upcoming field events at each site including groundwater sampling, monitoring well installations, soil sampling, or remediation activities
- Make suggestions for improving communication the Army welcomes and appreciates community feedback

# Restoration Advisory Board Meeting Hydrogeology 101: Definitions

**Permeability:** Permeability is a material's ability to allow fluids to pass through it. Permeable materials, such as gravel and sand, allow water to move quickly through them, whereas impermeable material, such as clay, doesn't allow water to flow freely

Aquifer: a water bearing consolidated or unconsolidated geologic unit (such as fractured rock, gravel, or sand) or set of connected units that yields a useable quantity of water

Aquitard: a geologic material, stratum, or formation of low permeability such as clay (also called a confining unit) that impedes movement of water vertically or horizontally

**Potentiometric Surface:** a map of water-table elevations in an aquifer unit used to identify potential groundwater flow directions and pathways

**Plume:** a three-dimensional body of fluid emanating from source or sources with a chemistry or physical composition differing from the background groundwater

**DNAPL:** Dense non-aqueous phase liquid. Forms from high concentrations of a contaminant denser than water that will sink when released into a groundwater aquifer

Hydrogeology: The study of the distribution and movement of fluids through geologic formations

## **Restoration Advisory Board Meeting** Hydrogeology 101: Groundwater Zones at LHAAP

Contaminated Groundwater

Geologic Unit: Wilcox

Vadose Zone (unsaturated) ~10-25 feet thick

Shallow Groundwater Zone ~5-15 feet thick (sands)

Clay Confining Layer ~10-25 feet thick

Intermediate Groundwater Zone ~10-15 feet thick

Clay Confining Layer ~20-50 feet thick

Deep Groundwater Zone ~10-25 feet thick

Clay Confining Layer ~80-110 feet thick

Drinking Water Aquifer ~120-150 feet thick

**Geologic Unit Below Drinking Water Aquifer: Midway** 

### **Restoration Advisory Board Meeting** Hydrogeology 101: Contaminant Plume Migration

Figure 2.1 Schematic illustration of a DNAPL and a LNAPL in a porous medium, showing geologic and pore scales. A low-permeability clay layer deflects the DNAPL. DNAPL dissolution causes a plume (from Mackay and Cherry, 1989).

Figure 2.5 Conceptual scenarios for a DNAPL in the groundwater zone in granular aquifers: a) partial penetration; b) partial penetration with offset; c) full penetration with offset; and d) same as part c, but at a later stage after DNAPL residual has disappeared due to dissolution in flowing groundwater. (Pankow and Cherry, 1996)

#### www.Bhate.com

# Restoration Advisory Board Meeting LHAAP-03 Final Record of Decision

#### Site Background

- LHAAP-03 was a waste collection site (approx. 16-feet x 15-feet) outside of the paint shop located within the boundary of LHAAP-35A(58) VOC plume
- Heavy metal-based primers, other waste paint, waste solvents and contaminated rags were collected in a 55-gallon drum on a gravel pad in an open-sided shed
- Soil is contaminated with various heavy metals, but only arsenic and lead are present at concentrations of concern for leaching to groundwater
- Groundwater is generally encountered 12 to 16 feet (ft) below ground surface (bgs) and is indistinguishable from that of LHAAP-35A(58)
- The groundwater contaminated with volatile organic compounds (VOCs) under LHAAP-03 is not site related and is being addressed as part of the remedy for site LHAAP-35A(58)
- Investigation Summary
  - Human Health Risk Assessment completed in 2003
  - Baseline Ecological Risk Assessment completed in 2007 (updated 2014)
  - Remedial Investigation/Focused Feasibility Study completed in 2013
  - Proposed Plan published for Public Comment in 2013
  - Record of Decision (ROD) awaiting regulatory signature/concurrence in July 2018
  - ESD is being routed for signatures/concurrence in July 2018

www.Bhate.com

## Restoration Advisory Board Meeting LHAAP-03 Location

www.Bhate.com

## Restoration Advisory Board Meeting LHAAP-03 Selected Remedy

- Selected Remedy
  - Soil contaminated with lead and arsenic above groundwater protective cleanup values will be excavated and disposed of offsite at an appropriately licensed disposal facility
  - Excavation area will be backfilled with compacted clean fill and re-seeded
- Remedial Path Forward
  - Pre-excavation sampling to refine the extent of excavation
  - Prepare a Remedial Design/Remedial Action Work Plan
  - Implement Remedial Action
  - Prepare Remedial Action Completion Report (RACR)
