Re: Final Post Screening Investigation Addendum No. 2 Report for LHAAP-47, Plant 3 Area, Solid Rocket Motor Fuel Production Longhorn Army Ammunition Plant, Karnack, Texas

Dear Ms. Poulos,

An electronic copy and 2 CD copies of the above-referenced document are being transmitted to you for your records.

The document was prepared by HDR Environmental, Operations and Construction, Inc. (HDR) on behalf of the Army as part of HDR's contract for the facility. I ask that Phil Werner, HDR's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

Copies furnished:
A. Palmie, TCEQ, Austin, TX (1 electronic only)
A. Williams, USACE, Tulsa District, OK (1 electronic only)
R. Smith, USACE, Tulsa District, OK (1 electronic only)
A. Maly, USAEC, San Antonio, TX (1 electronic only)
P. Bruckwicki, Caddo Lake NWR, TX (1 electronic only)
K. Nemmers, Bhate, CNTR (1 electronic only)

Comments Response Matrix
Draft Report: LHAAP-47 Post-Screening Investigation Addendum No. 2 Report for LHAAP-47, Plant 3 Area,
Solid Rocket Motor Fuel Production, Longhorn Army Ammunition Plant, Karnack, Harrison County, Texas
Draft Report Submitted: October 26, 2020
Draft Final Report Submitted January 11, 2021

Document Submitted by: Rose Zeiler - BRAC Field Manager
Comments Submitted by: April Palmie -TCEQ
Responded by: Joy Rogalla, Phil Werner - HDR
Date Responded: Draft 1/11/2021; Draft Final 2/11/2021

1. **Respondent concurs (C), does not concur (D), Takes Exception (E), or Delete (X)**
2. **Commenter agrees (A) or does not agree (D) with response.**

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
Reviewer #1: April Palmie, TCEQ									
1.	Page 4 of pdf	Attachments	Include a list of figures. In attachments list, be consistent with page numbers. Either include page numbers for everything (and correct table page numbers) or don't include page numbers for any attachments on pages 4 & 5. Please add pdf bookmarks for attachments 1 and 3-5.	C	A list of Figures will be added and figure and table page numbers will be included. Bookmarks will be added to the attachments as noted.		Most of the items listed above relate to the list of figures in comment one and my check to make sure all figure numbers were identified correctly following the changes.	C	Figure captions have been revised as noted. Refer to response to January 25, 2021 comment 2.
2.	Attachments (general)	Pdf bookmarks and formatting	Please add pdf bookmarks for Attachments where they are missing. Also, please add page numbers within the attachments where appropriate (for example on 2-number consecutive pages of a table).	C	Bookmarks will be added as requested, along with page numbers where appropriate	A			

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
3.	1.1/1	2nd Paragraph	Please clarify this sentence by including reference to 2018: TCE was reported in Upper Intermediate Zone replacement well 47WW25R, a replacement well for dry Shallow Zone well 47WW25 (installed during the first phase of the PSI), at a concentration of 120,000 µg/L.	C	A Reference to the PSI report has been added.	A			
4.	1.1.1/1	3rd and 4th Paragraphs	Please include Figures 7 and 8 from the March 2019 PSI Report (or similar new figures) and add reference the figures in these paragraphs.	C	The figures from the 2019 PSI report have been added and referenced in the text. In addition, Figure 4 has been replaced by 2 new figures showing the extent of TCE in the Shallow and Intermediate/Upper Intermediate Zones with the 2018 plumes overlaid on the 2020 plumes. The text has been revised to reference these figures.		First sentence of response, please add the figure numbers. Second sentence of response, after "two new figures" add (Figures 6 and 7).	C	The figures from the 2019 PSI report have been added as Figures 3 and 4, and are referenced in the text. In addition, the previous Figure 4 has been replaced by 2 new figures (Figures 6 and 7) showing the extent of TCE in the Shallow and Intermediate/Upper Intermediate Zones with the 2018 plumes overlaid on the 2020 plumes. The text has been revised to reference these figures. The text in Section 1.1.1 has been further revised to reference Figures 3 and 4 as well as the new Figures 6 and 7 showing the 2018 extent of TCE and perchlorate in the Shallow and Intermediate Zones.

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
5.	1.1.2/2-3	Soil and Groundwater	Add references to the relevant figures and tables.	C	Additional figure and table references have been added. As noted in response to comment 4, two new figures have been included (now Figures 6 and 7) to show the 2010 and 2019 TCE and perchlorate plumes. A reference to the 2019 PSI report has also been added.	A			
6.	1.1.2/3	1st Paragraph of GW	Revise as shown in red: Sample results were compared to the TCEQ Texas Risk Reduction Program (TRRP) Protective Concentration Level (PCL) for residential groundwater use ($^{GW}GW_{Ing}$) (TRRP PCL) and Safe Drinking Water Act (SDWA) Maximum Contaminant Levels (MCLs). Global edit: Replace any other use of $^{GW}GW_{Ing}$ in the document with TRRP PCL. For example first sentence of next paragraph becomes: Six VOCs were detected at varying concentrations, of these, ~~2~~ two compounds (acetone and toluene) were detected at low estimated concentrations well below their respective ~~GWGWIng~~ TRRP PCL.	C	The text has been revised as requested. All references have been changed to TRRP PCL.		Text was not edited exactly as requested. Please correct "residential groundwater use" to put back "($^{GW}GW_{Ing}$)" before "(TRRP PCL)". There should be one initial complete reference to the TRRP groundwater ingestion pathway. This also should not have been removed from the acronym list, just from other occurrences in the narrative. Put this back in the acronym list: $^{GW}GW_{Ing}$ Tier 1 Residential Groundwater Protective Concentration Level (PCL).	C	The text and acronym list have been revised as requested. The text has been revised as: "Sample results were compared to the TCEQ Texas Risk Reduction Program Protective Concentration Level for residential groundwater use ($^{GW}GW_{ing}$) (TRRP PCL) and Safe Drinking Water Act (SDWA) Maximum Contaminant Levels (MCLs)." $^{GW}GW_{ing}$ has also been added to the acronym list. These are the only locations in the document where this term occurs, and a global search has been completed to confirm there are no other occurrences and all references to the cleanup level reference the TRRP PCL.

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
7.	2.3/7	2nd Paragraph	Please clarify this sentence: The new monitoring existing monitoring well locations are shown on **Figure 6**.	C	The text has been clarified to state "new and existing monitoring well locations.…"	A			
8.	2.3/7	4th Paragraph	Explain the exceptions noted in this sentence: The PVC well screen was constructed with 0.01 inch slots and were 10 feet in length, with the exception of wells 47WW50, 47WW51, 47WW53, and 47WW54.	C	The text has been clarified to state that 10-foot screens were installed in the Shallow Zone wells and 5-foot screens in the Upper Intermediate Zone wells.	A			
9.	2.5/8		Please include well abandonment documentation in the report attachments.	C	The well abandonment documentation has been added to Attachment 3.	A			
10.	3.1/10	1st Paragraph	Please say DPT borings were "completed" rather than "performed"	C	All references to the DPT borings have been changed to 'completed'.	A			
11.	3.2/12		Revise last sentence to be consistent with comment 6 notes (TRRP PCLs)	C	The PCL reference has been revised as requested.	A			
12.	3.2.2/15	3rd Paragraph	Add reference to Figure 10 with the residual DNAPL discussion	C	Reference to Figure 13 (formerly Figure 10) has been added.		Correct response to Figure 19 (Figure 10 is now Figure 19). Also, add to response that this section has now been renumbered due to addition of 3.2.1 section. These comments (12 and 13) for 3.2.2 are now for 3.2.3.	C	Reference to Figure 19 (formerly Figure 10) has been added. This section has been renumbered to Section 3.2.3 due to the addition of Section 3.2.1 presenting the discussion of groundwater elevations and cross-sections.
13.	3.2.2/17	1st and 2nd paragraphs	Last sentence of first complete paragraph should reference Figure 17. 2nd paragraph describes 47WW37 which is missing from	C/D	Reference to Figure 20 (formerly Figure 17) has been added.		a. See notes for comment 12 and add "additional text has been added the last paragraph of 3.2.3 to describe the difference".	C	a. 47WW37 is an intermediate zone well, 66 feet deep, approximately 20 feet deeper than the UI wells. Combining data from

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
			isoconcentration figures. Please add location of 47WW37 and include the concentration on Figure 17. Last sentence in paragraph is confusing since order of magnitude means X 10 – 180 is several orders of magnitude less than 120,000		47WW37 is an intermediate zone well, 66 feet deep, approximately 20 feet deeper than the UI wells. Combining data from different zones may be confusing so data for this well has not been added to Figure 20 but additional text has been added to describe the difference.		b. In response to the comment note, if 47WW37 is deeper intermediate, why does the 2019 narrative say: "Well 47WW37 is screened in the Upper Intermediate Zone, solely, and does not present the same limitations when evaluating the sample results." Perhaps this sentence should also be revised. c. Regardless or the narrative changes, the physical location of this well should be shown on the shallow and upper intermediate iso-concentration figures (now Figures 19 and 20). If the data is not applicable for contour due to screening that should be explained in a note. The physical location of the well should not be omitted. The red cross well symbol is for "Inter./Upper Inter. MW" per the figure legends, which includes this well. d. Also, the order of magnitude sentence was not corrected or noted (last paragraph in 3.2.3).	C C C	different zones may be confusing so data for this well has not been added to Figure 20 but additional text has been added to the last paragraph of Section 3.2.3 (formerly Section 3.2.2) to describe the difference. b. The reference to 47WW37 in the first paragraph of Section 3.2.2 (formerly Section 3.2.1) has been revised to state that this well is screened solely in the Intermediate Zone. This is now consistent with other references and discussion about this well. c. the well location has been added to Figures 19 and 20, and a note added to the legend on Figure 20 noting the concentration is not reflected in the Upper Intermediate Zone contour. The note states: "The TCE concentration for 47WW37 is not reflected in the isoconcentration contour since this Intermediate Zone well is screened 20 feet deeper than surrounding UI Zone wells"

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
									d. The text has been revised to state that the 47WW37 TCE concentration is several hundred orders of magnitude less than that reported in 47WW25R.
14.	4.2/19	1st paragraph	Should reference Figure 17	C	The reference has been corrected to Figure 20 (formerly Figure 17).	A			
15.	4.2/20	3rd paragraph	Consider this revision for clarity: This result suggests ~~indicates~~ that the dissolved phase concentrations from the residual DNAPL ~~concentrations~~ decrease with depth.	C	The text has been revised as noted.	A			

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
16.	4.3/20		Add references to Figures 8 and 9. Highest TCE was 59.6 (fixed lab) [1st paragraph and later same section]	C/D	References to Figures 11 and 12 (formerly Figures 8 and 9) have been added. The figures include only field lab results because there is a complete data set. Fixed lab analyses were only performed for a small subset of samples (10 percent) and the results do not always correlate well as discussed in Section 3.2.3. This is due primarily to the different dilution levels used in the fixed and field labs. Adding the results from the fixed labs may introduce more confusion into the interpretation so the data have not been added to the figures. The mobile data, as presented, provides a clear picture of the level of contamination.		The narrative (3.2.4) and figures should include explanation that only field lab results were included.	C	The text in Section 4.3 has been revised to state that the posted results on Figures 11 and 12 are the field lab results for the highest concentration in the saturated or unsaturated zone.
17.	Table 1		Table 1 – fix width of water level column	C	The table formatting has been adjusted. Ft ags definition has been added to the notes.	A			
18.	Table 2		DPT-035 Add intermediate exposed screen length DPT-037 Why is the shallow water level blank?	C	DPT-037 has been noted as dry in the water level column. The Upper Intermediate exposed screen length for DPT-035 is included in the table. the Screen depth has been corrected to 39.5-49.5.	A			

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
19.	Table 4		Last column is not ft bgs. Please convert for consistency or add columns for well completion elevation.	C	The table has been corrected to indicate that groundwater elevation units are ft amsl, and a note added to define the units as feet above mean sea level.	A			
20.	Table 6		Please display results in mg/kg so the two soil tables are consistent. Or change table 5.	C	The Table 6 results have been converted to mg/kg.	A			
21.	Table 7		TRRP PCLs are updated every year. Please include reference to current year (sample year). Also this should reference Texas Risk Reduction Program (TRRP) Protective Concentration Level (PCL) for residential groundwater use	C	The PCL reference has been updated to November 2019. The PCL definition has been corrected to Protective Concentration Level.	A			
22.	Table 8		Is the methylene chloride lab contaminant? Can you add the dilution for some of-these results?	C	The laboratory data and data validation reports were reviewed to determine whether the methylene chloride can be attributed to laboratory contamination. Although there were trace detections in one lab blank and one trip blank, MC was not detected in the associated samples and no results were qualified due to blank contamination. Dilution factors are provided in the laboratory data files in Attachment 5 and reference to the detailed results has been added to table footnotes and text in Section 3.1.1.	A			

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
23.	Table 9		There is column before DPT-030 10-11 – it is unclear what these results are for (5,880 TCE). For soil tables, please pick mg/kg or µg/kg and convert accordingly. Please don't switch back and forth between tables. Recommend mg/kg soil results. Also note mg/kg is what is used in the figures. It is helpful if figures and tables are consistent within a report.	C	The extra column was incorrectly included has been deleted. All soil units in the tables have been changed to mg/kg.	A			

24.	Figures 8-9		Add the depths for the reported concentrations. Also, please explain the rationale for which result is depicted on the figures. I would expect it to be the highest but that doesn't seem to be the case (for example DPT-030 10-11 fixed lab result = 59.6 field lab = 16).	C	These are now Figures 11 and 12. Sample depths have been added to both figures as requested. The fixed lab results have not been added because there is only a small subset of samples (10 percent) with fixed lab results. Section 3.2.4 discusses the fixed/field lab data comparison and notes a lack of correlation between the paired results due mostly to differences in dilution and including both results on the figures may be more confusing. The field lab results provide a consistent data set across all samples. A Note has been added to the legend noting that the posted results represent the highest concentration for the unsaturated/saturated zone.		Comment 24 – The response says a note was added to Figure 11 and 12 regarding the posted results but it is not on the figures. Please add the note and also include the red text (or similar) "the posted results represent the highest concentration from the field lab results for the unsaturated/saturated zone".	C	The note has been added to the figures and text. The note added to Figures 11 and 12 is: "The posted results represent the maximum field laboratory concentration for each boring". The following text has been added to Section 3.1: "The posted results on Figure 11 and Figure 12 are the highest reported field laboratory concentrations for each boring in the unsaturated and saturated zones, respectively." The following has been added to the 1st paragraph in Section 4.3: "The field laboratory sample results are shown on the figure, and represent the highest concentration reported in the unsaturated zone for each boring. The field laboratory results are shown since all samples were analyzed and provide a complete data set while the fixed laboratory analysis was performed for only a subset of samples." The following has been added to the 5th paragraph in Section 4.3: "The field laboratory sample results

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
									are shown on the figure, and represent the highest concentration reported in the saturated zone for each boring. The field laboratory results are shown since all samples were analyzed and provide a complete data set while the fixed laboratory analysis was performed for only a subset of samples."
25.	Figure 10		The inset is confusing with 47WW14 shown in the top left corner. Please revise display area to remove the need for 47WW14 inset or move it to the right. Figure 17 is much easier to interpret. Please revise the title or add a note to include the date(s) of data collection depicted in the figure.	C	The inset has been moved to the right side of the figure (now Figure 19) to be consistent with the location relative to the main figure frame. The title has been revised to "2020 Shallow Groundwater TCE Iso-Concentration Contours"	A			
26.	Figures 15-17		Please revise the title or add a note to include the date(s) of data collection depicted in each figure.	C	The figure titles have been revised to note July 2020 for the Groundwater Elevation figures (now Figures 17 and 18) and to add 2020 to the iso-concentration figure (now Figure 20).	A			

Number	Section/Page	Paragraph/Line	Comment	C,D	Response	A,D	Draft Final Comment	C,D	Draft Final Response
27.	Figures Cross Sections		Thank you for the detailed cross sections. Add note of the units (TCE soil in mg/kg and groundwater in µg/L). Could soil or water results be a different color?	C	The units for soil and groundwater results are included in the notes in the legend. The colors for the groundwater and results has been changed to red and blue to differentiate from the soil results and the legend has been clarified to note the arrows indicate the sample intervals and results.		Thank you for the edits. Please consider this format (or similar) for future efforts.	C	This format will be used for future cross-sections
28.	Photo log		Please include a photo log to document field work and completed wells.	C	General site photos were not taken. Photos of the soil cores were taken and are provided in a photo log as Attachment 6		For future field efforts (at 47, 29, and 18/24), please document site activities and include a comprehensive photo log. Thank you for the explanation.	C	Site photographs will be taken during any future field efforts and provided in a photo log.
29.	Attachment 3		In Attachment 3, please increase the size of the first batch of boring logs (DPT 001-011) so they take up more space on the page. Hopefully, this will improve legibility. If not, please check figures for legibility and replace as needed. The first page of each log has illegible parts.	C	The boring logs for DPT-001 through DPT-011 have been replaced with higher resolution versions.		Much better. Please check for this type of problem on future documents as the draft version of the logs made document review difficult.	C	The format and resolution for future boring logs will be verified to be as high quality as possible.
30.	Attachment 4		Pdf pages 219-221 are in the wrong attachment	C	The pages have been removed. The drilling log and well completion forms are for 47WW24 that was installed in 2000 and was inadvertently included.	A

Acronym List	
Army	United States Army
bgs	below ground surface
COC	contaminant of concern
C/UI	Clay/Upper Intermediate
DNAPL	Dense non-aqueous phase liquid
DoD	Department of Defense
DOT	Department of Transportation
DPT	direct push technology drilling
ELAP	Environmental Laboratory Accreditation Program
EPA	U. S. Environmental Protection Agency
ft	feet
FS	Feasibility Study
GC/MS	Gas chromatography/mass spectrometry
$^{GW}GW_{Ing}$	Texas Risk Reduction Program Protective Concentration Level for residential groundwater use
GWP-Ind	industrial groundwater protection MSC
GWTP	groundwater treatment plant
HSA	Hollow stem auger
IDW	Investigation derived waste
IWWP	Installation Wide Work Plan
J	estimated concentration
LHAAP	Longhorn Army Ammunition Plant
LOQ	Level of Quantitation
MCL	maximum contaminant level
MDL	method detection Limit
mg/kg	milligram per kilogram
Mg/L	Milligrams per liter
MSC	medium-specific concentrations
mV	millivolts
NELAP	National Environmental Laboratory Accreditation Program
NTU	Nephelometric turbidity unit
PAL	Project Action Limits
PCE	tetrachloroethene
PCL	Protective Concentration Level
PID	photoionization detector
PP	Proposed Plan
PSI No. 2	LHAAP-47 Interim Post-Screening Investigation Addendum No. 2

PVC	polyvinyl chloride
ROD	Record of Decision
RPD	Relative percent difference
SDWA	Safe Drinking Water Act
SVOC	semi-volatile organic compound
TAC	Texas Administrative Code
TCE	trichloroethene
TCEQ	Texas Commission on Environmental Quality
TCLP	toxicity characteristic leaching procedure
TRRP	Texas Risk Reduction Program
VC	Vinyl Chloride
VOC	volatile organic compound
°C	Degrees Celsius
µg/L	micrograms per liter
µS/cm	Micro Siemens per centimeter
1,1-DCE	1,1-dichloroethene
cis-1,2-DCE	cis-1,2-dichloroethene

1.0 Introduction

This Post-Screening Investigation Addendum No. 2 Report (PSI No. 2) has been prepared for the former Longhorn Army Ammunition Plant (LHAAP) site LHAAP-47 (Plant 3 Area), located in Karnack, Texas (**Figure 1** and **Figure 2**). This document has been prepared under the U. S. Army Corps of Engineers Tulsa District Contract Number W912BV-15-D-0014, Task Order No. W912BV18F0023.The purpose of this investigation was to further investigate the source and extent of the high trichloroethene (TCE) concentration identified at replacement well 47WW25R installed and sampled during the PSI field activities performed between April and September 2018 (HDR, 2019).

This PSI addendum reports the results of additional investigations conducted in November 2019, and May through July 2020, and provides a summary of the results of the initial PSI conducted in 2018. The PSI No. 2 activities focused on the area near Building 46A where Upper Intermediate Zone well 47WW25R is located.

The PSI No. 2 field efforts were conducted in accordance with procedures outlined in relevant sections of the Installation Wide Work Plan (IWWP) (AECOM, 2014); specifically those procedures for conducting direct push technology drilling (DPT), groundwater sample collection, soil sample collection, handling and laboratory analyses, decontamination, handling and disposal of investigation derived waste (IDW), and surveying. The IWWP was reviewed by and concurrence was obtained from the Texas Commission on Environmental Quality (TCEQ) and the U.S. Environmental Protection Agency (EPA). The initial PSI field efforts were conducted in accordance with the *Post-Screening Investigation Work Plan LHAAP-47, Plant Area 3 Longhorn Army Ammunition Plant* (AECOM, 2016). The PSI No. 2 November 2019 field efforts were conducted in accordance with the *Final Post Screening Investigation Addendum No. 2 Work Plan, LHAAP-47 Building 46A, Plant 3 Area, Solid Rocket Motor Fuel Production, Longhorn Army Ammunition Plant Karnack, Texas* (HDR, 2019a). The PSI No. 2 May through July 2020 field efforts were conducted in accordance with the *Final Post Screening Investigation Addendum No. 2 Work Plan Addendum, LHAAP-47 Building 46A, Plant 3 Area, Solid Rocket Motor Fuel Production Longhorn Army Ammunition Plant Karnack, Texas (*HDR, 2020).

1.1 Background

Prior to 2018, the most recent samples collected at LHAAP-47 were collected in 2009 and 2010 to support development of the Feasibility Study (FS) alternatives. Following preparation of the FS, a Proposed Plan (PP) was completed in 2012 (AECOM, 2012), and a Record of Decision (ROD) was completed to the Draft Final Version in 2013 (AECOM, 2013). The ROD completion was delayed until resolution of a dispute between the U.S. Army (Army) and EPA. At that point, the Army determined that due to aging and limited data, additional data were required to support preparation of the Final ROD. The PSI was planned to re-assess and update groundwater contaminant levels for Shallow and Intermediate Zone groundwater.

During the groundwater investigations in 2009 and 2010 that included the collection of groundwater samples around Building 46A, the results showed TCE concentrations of 13,900 micrograms per liter (µg/L) at DPT boring 47DPT14 (completed in the Shallow Zone) and 13,300 µg/L at well 47WW25. TCE was reported in Upper Intermediate Zone replacement well 47WW25R, a replacement well for dry Shallow Zone well 47WW25 (installed during the first

phase of the PSI), at a concentration of 120,000 µg/L (HDR, 2019). Follow up investigations were conducted in 2019 and 2020 to identify the source of TCE and further define the extent of contamination in the vicinity of Building 46A. The results of these follow up investigations are reported in this document. This data will be used to supplement the historical data, as necessary to re-assess TCE in Shallow Zone and Upper Intermediate Zone groundwater, to update the FS to identify additional technologies that may be appropriate to remediate the TCE source area, and to inform the ROD prior to its finalization.

1.1.1 2018 PSI Results

The results of the initial PSI field effort that was conducted in 2018 provided a snapshot of subsurface contamination throughout the site, and sampling of groundwater at multiple borings and monitoring wells. Perchlorate, metals, Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and explosives are considered Contaminants of Concern (COCs) for the LHAAP-47 site, and groundwater samples were analyzed for these contaminants. From historical data, perchlorate and VOCs are known to be the most prominent contaminants at the site. A summary of the initial PSI results and findings is provided below. the results were reported in the PSI Report and detailed tables, figures and discussion are provided in that document (HDR, 2019)

The extent of contamination was re-evaluated based on the results of the initial phase of the PSI. Although extensive contamination remains at the site, the spatial extent of contamination in the Shallow and Intermediate Zone groundwater has changed. The majority of groundwater contamination now occurs within the Upper Intermediate Zone. **Figure 3** and **Figure 4** show the locations of monitoring wells and the extent of VOC and perchlorate plumes in 2018 in the Shallow and Upper Intermediate Zone groundwater, respectively.

The initial PSI conducted in 2018 indicated that a decline in water levels resulted in a large portion of the Shallow Zone going dry (**Figure 5**). As a result, the VOC extent of contamination in the Shallow Zone was substantially reduced when compared to the 2010 results. The contours indicating the extent of contamination in 2010 were presented in the 2011 FS. This change is evident as shown on **Figure 6**, showing the perchlorate plumes identified during previous investigations no longer exist and the TCE plume is much smaller. Based on the 2018 results, the extent of groundwater contamination in the Shallow Zone now consists of a single, small VOC plume in the vicinity of LHSMW44 and LHSMW45. **Figure 3** shows that the maximum extent of VOC contamination in the Shallow Zone is defined by TCE. Vinyl Chloride (VC) and cis-1.2-dichloroethene (DCE) were also detected in Shallow Zone well LHSMW45.

Due to the lack of groundwater in the Shallow Zone, replacement wells for dry Shallow Zone wells were completed through the sand-laminated clay underlying the Shallow Zone and into the Upper Intermediate groundwater zone (this zone is referenced as C/UI Zone) These replacement wells provided additional data points to define the contaminant plumes. Two separate VOC plumes depicted in 2010 (presented in the 2011 FS) are now shown to be connected as a result of analytical data obtained from replacement well 47WW11R (**Figure 7**). The eastward extent of contamination remains similar to that of 2010. The results of replacement wells 47WW11R and LHSMW43R also define the presence of an additional small perchlorate plume not defined by the 2010 data. **Figure 4** shows the maximum extent of VOC contamination in the Upper Intermediate/Intermediate Zone is defined by TCE, with smaller 1,2-

DCE, VC, cis-1,2-DCE, and tetrachloroethene (PCE) plumes within the maximum extent of the TCE plume.

The groundwater gradient in the Intermediate Zone has been verified to flow to the northeast toward Caddo Lake. The identified contaminant plumes reflect this in their orientation and shape.

1.1.2 2019 PSI Results

Soil Results - Eleven soil borings were completed and 33 soil samples were collected during this PSI field effort. All soil samples were analyzed for VOCs using EPA method SW8260B. Soil samples were collected to identify if a TCE source is present and identify the extent of TCE contamination in soil adjacent to Building 46A. This data will be used to supplement the historical data, as necessary, and to re-assess TCE in Upper Intermediate Zone groundwater to inform the ROD prior to its finalization. Through review of historical data, it was determined that the vadose (unsaturated) zone would be defined uniformly as 23 ft bgs. Based on this definition, all except 2 (the shallowest samples from DPT-006 and DPT-011) of the soil samples were collected deeper than 23 ft bgs and are considered to be within the saturated zone. For samples collected from the unsaturated zone, the results were compared to the TCEQ soil medium-specific concentrations (MSCs) for industrial use based on groundwater protection (GWP-Ind). The results for these borings are further discussed in **Section 3.1**, and tables and figures presenting the data are provided as part of that discussion.

Fourteen VOCs were detected at varying concentrations, of these, 10 compounds were detected at low, estimated concentrations. The remaining four VOCs with detectable concentrations above the method detection limit (MDL) included 1,1-DCE, cis-1,2-dichloroethene (cis-1,2-DCE), TCE, and VC. TCE was the most prevalent compound, and detected concentrations ranged from a high of 15.8 milligrams per kilogram (mg/kg) to a low of 0.0039 mg/kg. Boring locations with the highest detected TCE concentrations included DPT-003 (15.8 mg/kg at 29 – 30 ft bgs), DPT-007 (15.6 mg/kg at 31 – 32 ft bgs), DPT-001 (11.8 mg/kg at 27 – 28 ft bgs), DPT-004 (8.37 mg/kg at 28 – 29 ft bgs), DPT-010 (4.1 mg/kg at 32 – 33 ft bgs), and DPT-011 (3.81 mg/kg at 27 – 28 ft bgs). Based on these results, the depth interval with the highest TCE concentrations is between 27 and 33 ft bgs and centered on borings DPT-001, DPT-003, DPT-004, and DPT-007. Of the 2 unsaturated zone samples, the 22-23 ft bgs sample from DPT-011 exceeded the GWP-Ind MSC of 0.5 mg/kg, with a concentration of 1.1 mg/kg. The sample collected from DPT-006 from 20-21 ft bgs had a detected TCE concentration of 0.0684 mg/kg, less than the GWP-Ind MSC.

A more detailed discussion of the 2019 results is presented in **Section 3.1.**

Groundwater results - Groundwater samples were collected from all eleven DPT borings and wells 47WW25R and 47WW37 for VOC analysis, and from DPT borings DPT-001, DPT-005, and DPT-010, and well 47WW09 for 1,4-dioxane analysis. Samples from DPT-001 through DPT-011 and 47WW25R were collected from a screened interval set in the lower part of the laminated clay/sand unit and extended into the Upper Intermediate Zone sand layer (C/UI). All groundwater samples analyzed for VOCs were tested using EPA method SW8260B, while the

1,4-dioxane samples were analyzed using EPA method SW8270D. Sample results were compared to the TCEQ Texas Risk Reduction Program Protective Concentration Level for residential groundwater use ($^{GW}GW_{ing}$) (TRRP PCL) and Safe Drinking Water Act (SDWA) Maximum Contaminant Levels (MCLs). Groundwater samples were collected to confirm an anomalously high concentration of TCE reported in well 47WW25R and to assess TCE concentrations in the UI Zone around Building 46A. This data will be used to supplement the historical data, as necessary, and to re-assess TCE in Upper Intermediate Zone groundwater to inform the ROD prior to its finalization.

Six VOCs were detected at varying concentrations, of these, two compounds (acetone and toluene) were detected at low estimated concentrations well below their respective TRRP PCL. The remaining four VOCs included cis-1,2-DCE, methylene chloride, TCE, and vinyl chloride (VC). The compound 1,4- dioxane was detected in one of the four samples collected for analysis. The following discussion focuses on these four compounds and the 1,4-dioxane detection. The VOC TCE was the most prevalent compound detected: all 14 samples analyzed had a detectable concentration above the MDL that exceeded the MCL of 5 µg/L. Concentrations ranged from a low estimated (J) value of 29 J µg/L to a high of 140,000 µg/L. Well 47WW25R had the highest concentrations of TCE at 140,000 µg/L, confirming the sample result from this well during the 2018 PSI (HDR, 2019). Well 47WW37 had a detected concentration of 190 µg/L, higher than the 29.4 µg/L detected in 2010. Well 47WW37 is located approximately 40 feet to the south of 47WW25R and is screened in the Intermediate Zone groundwater at 61 ft bgs. Boring locations with the highest detected concentrations included DPT-007 (77,000 µg/L), DPT-008 (36,000 µg/L), DPT-011 (22,000 µg/L), DPT-010 (18,000 µg/L), and DPT-005 (5,400 µg/L). Based on these results, the highest TCE groundwater concentrations appear to be centered on well 47WW25R and borings DPT-005, DPT-007, DPT-008, DPT-010, and DPT-011. When comparing the groundwater to the soil TCE results, only soil samples taken from DPT-007, DPT-010, and DPT- 011 had relatively high TCE concentrations.

The concentrations of TCE in groundwater near Building 46A are sufficiently high to indicate the possible presence of residual dense non-aqueous phase liquid (DNAPL) within the saturated zone. As noted in *An Introduction to Characterizing Sites Contaminated with DNAPLs* (ITRC, 2003), "one indication of the presence of DNAPL in the saturated zone in a monitoring well with a long well screen (at least 10 ft long), is that the concentration of the contaminant is greater than one to ten percent (1-10%) of the compound's effective solubility." Based on this definition, the estimated DNAPL threshold concentration for TCE is 11,000 µg/L. While this "rule of thumb" is not a conclusive indication of DNAPL, the reported concentrations of TCE near Building 46A indicate the potential presence of residual DNAPL. A TCE concentration of 10,000 µg/L was used as a conservative estimate for evaluating the presence of residual DNAPL for the PSI data.

A more detailed discussion of the 2019 results, including tables and figures is presented in **Section 3.2.**

2.0 Field Investigation Activities

This section describes the activities and methods used to perform soil sampling and analyses, groundwater sampling and analyses, surveying, and IDW management and disposal for PSI field activities completed in November 2019 (2019) and between May and July 2020 (2020).

2.1 DPT Advancement: Soil Sampling and Analyses

Soil borings installed in 2019 were advanced using a GeoProbe 7730 DT rig fitted with 5 foot Macro-cores® lined with acetate sleeves and completed at depths between 34 and 44 ft bgs, several feet into the Upper Intermediate Zone sand. Three soil samples were collected from each boring at varying depths and analyzed for VOCs. All soil samples were analyzed by EPA Method SW8260B. Method 8260B is a gas chromatography/mass spectrometry (GC/MS) analytical method used to determine VOCs in a variety of solid waste matrices, and was used by the mobile and stationary labs. Confirmation soil samples (and groundwater) were collected at a rate of 10 percent and sent to a fixed laboratory (MicroBac Laboratories) to correlate the mobile laboratory results. The mobile lab (PACE Analytical) is accredited under the Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) and TCEQ National Environmental Laboratory Accreditation Program (NELAP) programs. The samples were generally collected at the bottom of the upper sand (i.e. Shallow Zone), the middle of the upper clay, and the contact between the base of the clay and top of the lower sand; depths to these contacts varied between boreholes. Note: the middle of the upper clay and base of the clay are within the C/UI Zone.

After the core barrel was advanced to the target depth, the rods and core barrel were removed from the borehole. The acetate sleeve containing the soil core was then removed from the sample barrel and screened using a calibrated photoionization detector (PID). The VOC soil samples were collected using Terra Core™ kits based on the sample depth criteria listed above. Soil cores were then logged using the Unified Soil Classification System Standard Practice for Classification of Soils. Boring logs are provided in **Attachment 3**. A photo log showing the soil cores is provided as **Attachment 6**.

The DPT sampling equipment was decontaminated after each interval to prevent cross contamination. Decontamination water was containerized and disposed at the groundwater treatment plant (GWTP). Excess soil cuttings not collected for a sample were containerized in Department of Transportation approved 55-gallon open-top drums and left adjacent to the borehole until categorized as either hazardous or non-hazardous. One composite sample was collected and analyzed using the toxicity characteristic leaching procedure (TCLP) for VOCs, SVOCs, herbicides, pesticides, and metals/mercury, as well as ignitability, corrosivity, and reactivity; all results came back negative for hazardous characteristics and the soil was spread adjacent to the pertinent boring in accordance with the IWWP.

The DPT borings completed in 2020 were advanced using a GeoProbe 7822DT Rig to between 31 and 51 ft bgs. Twenty-seven borings were drilled and 4 soil samples were collected with the exception of 1 boring, which had 6 samples, and analyzed for selected VOCs in a field laboratory. Ten samples were selected for fixed laboratory analysis for a full suite of VOCs. The same sample collection and decontamination procedures were followed as for the 2019 samples. The 2020 DPT boring logs are provided in **Attachment 3**.

The DPT boring locations for 2019 and 2020, and historic DPT and soil boring locations are presented in **Figure 8**. Details of the DPT boring depths, groundwater zone, and water table elevations are provided in **Table 1 and Table 2**. The list of analytes, number of samples collected, and methods used for both investigations are provided in **Table 3.**

2.2 Temporary Well Installation and Groundwater Sample Collection

Temporary wells were installed at the DPT locations as specified in the *Final Post Screening Investigation Addendum No. 2 Work Plan, LHAAP-47 Building 46A, Plant 3 Area, Solid Rocket Motor Fuel Production, Longhorn Army Ammunition Plant Karnack, Texas* (HDR, 2019a) and *Final Installation-Wide Work Plan for Longhorn Army Ammunition Plant* (AECOM, 2014).

Temporary 1-inch polyvinyl chloride (PVC) wells with 10-foot screens and 0.01-inch slot size were installed in each 2019 DPT boring.

For the 2019 field effort, the screens were set at a depth that intercepted the clay unit (C/UI Zone) underlying the Shallow Zone sand extending into the Upper Intermediate Zone sand an average of approximately 5 feet. The well was then allowed to equilibrate over 10 to 24 hours.

One discrete grab groundwater sample was collected from each DPT boring using 0.5-foot bailers. One sample collected at well 47WW25R was collected at a depth consistent with the pump intake depth for the 2018 sample from 47WW25R, that is, at the base of the clay unit (35 ft bgs), while the second sample was collected at 38 ft bgs, two-feet above the boring termination depth. All samples collected from the temporary wells were analyzed for VOCs, while samples collected from DPT borings DPT-001, DPT-005, and DPT-010 were also analyzed for 1,4-dioxane. Groundwater samples were collected from wells 47WW25R and 47WW37 for VOCs analyses, and from 47WW25R and 47WW09 for 1,4-dioxane analysis. Samples collected for 1,4-dioxane analyses were to confirm the compound remains a COC based on historical sampling result at 47WW09 in 2015 of 27.4 ug/L and 47WW25R's high TCE concentration, which is an indicator for the potential presence of 1,4-dioxane.

The wells were purged using low flow techniques using a variable speed submersible bladder pump. IDW purge water was collected in 5-gallon buckets and disposed at the GWTP. Prior to purging the monitoring wells, water level measurements were collected and recorded. Purging was considered complete when measurements of temperature, pH, electrical conductivity, turbidity, dissolved oxygen and redox potential stabilized. Stabilization was defined as follows: 1) temperature ±10% degrees Celsius (°C); 2) pH ±0.1 units; 3) electrical conductivity ±3% micro Siemens/centimeter (µS/cm); 4) turbidity ±10% and <50 Nephelometric Turbidity Units (NTUs); 5) dissolved oxygen ±10% milligrams per liter (mg/L); and 6) redox potential ±10 millivolts (mV). With the exception of turbidity, measurements were collected using an inline flow cell and YSI 556 water quality meter. Turbidity was collected separately using a Hanna turbidity meter. Stabilization parameters and purge volumes from each well were recorded and are provided in **Attachment 4**.

For the 2020 DPT borings, shallow temporary wells were installed first to the target depth and samples collected. The DPT rig was then offset several feet and subsequently the Upper Intermediate borings were advanced. The Upper Intermediate Zone temporary wells were installed using a dual tube method to ensure that the Shallow Zone would be isolated from the deeper zone. For the Upper Intermediate Zone temporary wells, the larger diameter set of rods

was driven through the confining clay unit into the Upper Intermediate Zone sand to serve as an outer casing. Temporary 1-inch PVC wells with 10 foot screens and 0.01-inch slot size were then installed inside the inner rod. The inner rod was then pulled back to expose only the length of screen that penetrated into the Upper Intermediate Zone sand layer and at least one foot below the overlying confining clay unit. The exposed screen lengths are indicated in **Table 2**.

Borings with both Shallow and Upper Intermediate Zone temporary wells included DPT-015, DPT-016, DPT-017, DPT-018, DPT-019, DPT-020, DPT-021, DPT-022, DPT-023, DPT-024, DPT-026, DPT-028, DPT-029, DPT-032, DPT-033, and DPT-035. Several temporary wells in the Shallow zone were dry and samples were not collected; these include borings DPT-014, DPT-018, DPT-020, DPT-021, DPT022, DPT-028, DPT-036 and DPT-038. Borings with solely Shallow zone temporary wells include DPT-012, DPT-013, DPT-014, DPT-025, DPT-027, DPT-030, DPT-030, DPT-031, DPT-034, DPT-036, and DPT-037. **Table 2** presents the 2020 temporary well installation details. Groundwater samples were collected from each screened interval and analyzed in a field laboratory for selected VOCs. Four samples were collected and submitted for fixed laboratory analysis for the full suite of VOCs (refer to **Table 3**).

2.3 Monitoring Well Installation

Eight monitoring wells were installed between 23 June and 16 July 2020. Four wells were installed in the Shallow Zone, and 4 in the Upper Intermediate Zone. The Work Plan specified that the Upper Intermediate Zone wells were to be completed so that the top of the open interval was no less than one foot below the sand-laminated clay. Per the Work Plan, one Shallow Zone well was to be installed to replace 47WW25R and completed several feet into the underlying clay no deeper than two feet above the Upper Intermediate Zone sand; five Upper Intermediate Zone wells were to be installed to a maximum depth of 50 ft bgs with the top of the screens a minimum of 2 feet below the clay unit (a minimum of one, but up to two of these Upper Intermediate Zone wells were planned to be installed as Shallow Zone wells depending on data results); one Intermediate Zone well was to be installed to approximately 60 ft bgs; and one deep well was to be installed to 120 ft bgs. Based on discussions during the field investigation, agreement was reached with TCEQ and EPA that 4 Shallow Zone, 4 Upper Intermediate Zone wells would be installed rather than the planned depths identified in the Work Plan.

Shallow Zone wells include 47WW48, 47WW49, 47WW52, and 47WW55, while Upper Intermediate Zone wells include 47WW50, 47WW51, 47WW53, and 47WW54. Monitoring well 47WW25R was abandoned, replaced by 47WW49. The exploratory borings were advanced to identify depth of the underlying clay layer to determine well depths. The new and existing monitoring well locations are shown on **Figure 9**.

Monitoring wells 47WW48 through 47WW53 and associated exploratory borings were drilled using the Geoprobe 3230DT Hollow Stem Auger (HSA) rig. Monitoring wells 47WW54 and 47WW55 were drilled using the Geoprobe 8150LS sonic rig. The monitoring wells were installed in the annulus of the HSA of the 3230DT rig and inside the telescoping drill stem of the sonic rig to limit any drag-down of contamination. Well installation and development was performed following the procedures specified in the IWWP (AECOM, 2014). The well drilling and completion logs and well registration forms are provided in **Attachment 3**.

Each well was constructed with flush-joint threaded, schedule 40 PVC. The PVC well screen was constructed with 0.01 inch slots and were 10 feet in length, for the Shallow Zone wells. Five-foot screens were installed in Upper Intermediate Zone wells 47WW50, 47WW51, 47WW53, and 47WW54. The 5 foot screens were installed to monitor the upper part of the Upper Intermediate Zone and were placed in the sand unit underlying the multi-layered clay/silt layer separating the Shallow and Upper Intermediate Zones. A threaded PVC bottom cap was secured to the bottom of the screen interval. Solid PVC casing was installed from the top of the screen interval to approximately three feet above surface grade. A filter pack consisting of clean silica sand (20 to 40 size) was placed in the auger or drill stem annulus from the well bottom to approximately two feet above the screen interval. A two to three foot thick bentonite seal (pellets or chips) was placed above the sand filter pack and hydrated with portable water. The annular space from the top of the bentonite seal to the surface was filled with a bentonite-cement grout.

For the Intermediate Zone wells, the Shallow Zone groundwater was isolated using a suitable diameter schedule 40 PVC casing. The casing was installed from the surface grade to the top of the clay unit separating the Shallow Zone and Upper Intermediate Zone. The depths to the clay units were between 30 and 37 ft bgs. Upon grouting and setting of the surface casing, drilling proceeded into the intermediate zone.

The drilling equipment was decontaminated prior to the arrival at the site and between wells. Upon completion of drilling activities the drilling equipment was decontaminated prior to demobilizing and leaving the installation. Decontamination water was containerized and disposed at the GWTP. Excess soil cuttings not collected for a sample were containerized in Department of Transportation (DOT) approved 55-gallon open top drums and left adjacent to the borehole until categorized as either hazardous or non-hazardous.

Well surface completions were constructed for each monitoring well installed. Surface completion consists of a protective steel casing, with a hinged, lockable lid set in a concrete pad. Concrete-filled steel bollards were installed at the corners of the concrete pads. The monitoring wells and surface completions were installed in accordance with State of Texas requirements by a drilling subcontractor (Walker-Hill) licensed in the State of Texas. The monitoring wells comply with applicable technical requirements of 30 Texas Administrative Code (TAC) Chapter 76. State of Texas Well Reports were submitted to the Texas Department of Licensing and Regulation for each well installed. **Table 4** presents the monitoring well installation details.

Well development was performed by pumping and gentle surging of the screened interval. A minimum of three well borehole volumes of water was removed. The volume of groundwater removed from each well was calculated from the static water level measurement referenced from the top-of-casing. An electronic interface probe was used to measure the water levels.

Water quality parameters (temperature, pH, electrical conductivity, dissolved oxygen, and turbidity) were monitored during development. Development continued until the water quality parameters stabilized and the water was visually clear. Decontamination water was containerized and disposed at the GWTP.

One groundwater sample was collected from each newly installed well and sent to a fixed laboratory for analysis. The wells were purged using low flow techniques. Prior to purging the

monitoring wells, water level measurements were collected and recorded. Purging was considered complete when measurements of temperature, pH, electrical conductivity, and turbidity stabilized. Stabilization was defined as follows: 1) temperature ±10% °C; 2) pH ±0.1 units; 3) electrical conductivity ±3% µS/cm; and 4) turbidity ±10%. With the exception of turbidity, measurements were collected using an inline flow cell. Turbidity samples were collected separately and measured using a turbidity meter. Purge volume from each well was recorded. Again, purge water was containerized and disposed at the GWTP.

Once the groundwater samples were collected they were sent to the analytical laboratory (Microbac Laboratories, Inc.) for analysis of VOCs utilizing EPA Method SW8260B. Sample collection and handling was conducted in accordance with the IWWP (AECOM, 2014). The low-flow sampling logs are provided in **Attachment 4**.

2.5 Well Abandonment

After sampling, well 47WW25R was plugged and abandoned on June 16, 2020 in accordance with the District Rules, Pineywoods Groundwater Conservation District and pertinent requirements of 30 TAC 76.1004 and 30 TAC 76.1005. The well was open a few feet into the overlying clay confining unit (C/UI), which is believed to contain residual TCE DNAPL. Therefore, concentrations of TCE observed at 47WW25R may not be representative of groundwater in the Upper Intermediate Zone and the potential for cross contamination existed, and abandoning the well was deemed necessary. In general, the well was abandoned in place by grouting from bottom to top with a cement-bentonite grout. When completed, a well abandonment report and notice required by the Texas Water Development Board and Texas Department of Licensing and Regulation was prepared and submitted. The well abandonment documentation is provided in **Attachment 3**.

2.4 Surveying

HDR collected the horizontal coordinates (northing and easting) at each borehole location using a Trimble Global Positioning Unit. The data, based on the North American Datum of 1983, was used to develop geospatially referenced site maps and to update existing cross-sections provided in **Attachment 1**.

A professional land surveyor licensed in the State of Texas surveyed the locations and elevations of the newly installed monitoring wells. The horizontal coordinates (northing and easing) of the wells were surveyed to the nearest foot based on the North American Datum of 1983. The vertical elevations of the top of the wells (top-of-casing) were based on the North American Vertical Datum of 1988 and were surveyed to the nearest 0.01 feet at a reference point (i.e., groove or marking on the north side of the well casing) used to collect water level measurements. The ground surface elevation at each well location was surveyed to the nearest 0.1 foot.

3.0 Investigation Findings

3.1 Soil Sample Results

Eleven DPT borings were completed and soil samples collected during the 2019 field activities. Soil sample locations and collection procedures described in the IWWP (AECOM, 2014) and *Final Post Screening Investigation Addendum No. 2 Work Plan, LHAAP-47 Building 46A, Plant 3 Area, Solid Rocket Motor Fuel Production, Longhorn Army Ammunition Plant Karnack, Texas* (HDR, 2019a). Based on the results, additional borings were determined necessary to delineate the extent of VOC contamination in the vicinity of Building 46A, so an additional 27 DPT borings were completed and soil samples collected during the 2020 field activities as described in the *Final Post Screening Investigation Addendum No. 2 Work Plan Addendum for LHAAP-47, Plant 3 Area* (HDR, 2020). This data will be used to supplement the historical data, as necessary, and to re-assess TCE in Shallow Zone, C/UI, and Upper Intermediate Zone groundwater to inform the ROD prior to its finalization.

Existing data were evaluated to determine the historical depth to groundwater and depth of the unsaturated zone. A uniform depth of 23 ft bgs was determined to represent the depth of the unsaturated zone soil to be used to evaluate the PSI data. Soil samples were collected from both the saturated and unsaturated zone during the PSI No. 2 investigations, however only the results from less than 23 ft bgs are considered to represent unsaturated soil and the results were compared with the GWP-Ind MSC to identify locations with exceedances. Since the samples from depths greater than 23 ft bgs are within the saturated zone, those results are considered to be associated with groundwater contamination. **Figure 8** shows all Addendum 2 DPT locations, and the results are shown on **Figure 10**.

3.1.1 2019 Soil Sample Results

Eleven soil borings were completed and 33 soil samples collected during the 2019 field investigation (**Figure 10**). All soil samples were analyzed for VOCs using EPA method SW8260B. Sample results from depths to 23 ft bgs were compared to the TCEQ MSCs for industrial use, GWP-Ind. Soil samples were collected to identify if a TCE source is present and identify the extent of TCE contamination in soil adjacent to Building 46A.

Fourteen VOCs were detected at various concentrations, of these, 10 compounds were detected at low estimated concentrations. The remaining four VOCs with detectable concentrations above the MDL included 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), TCE, and vinyl chloride. The following discussion focuses on these four compounds.

Trichloroethene was the most prevalent compound detected: 24 out of 33 samples analyzed had a detectable concentration above the MDL, while another 5 samples had estimated values. The remaining 14 detections were from the saturated zone soil samples ranged from a high of 15.8 mg/kg to a low of 0.000894 mg/kg. Boring locations with the highest detected concentrations included DPT-003 (15.8 mg/kg at 29 – 30 ft bgs), DPT-007 (15.6 mg/kg at 31 – 32 ft bgs), DPT-001 (11.8 mg/kg at 27 – 28 ft bgs), DPT-004 (8.37 mg/kg at 28 – 29 ft bgs), DPT-010 (4.1 mg/kg at 32 – 33 ft bgs), and DPT-011 (3.81 mg/kg at 27 – 28 ft bgs). Based on these results, the depth interval with the highest TCE concentrations are within the saturated soil in the clay unit between 27 and 33 ft bgs and centered on borings DPT-001, DPT-003, DPT-

004, and DPT-007. This is the clay with fine sand lamination above the Upper Intermediate Zone. As shown in the boring logs in **Attachment 3**, the lithology for this depth range is predominantly clay, interspersed with thinner lenses of sand and silt.

The VOCs 1,1-DCE, cis-1,2-DCE, and vinyl chloride were all detected at concentrations above their respective MDLs. Cis-1,2-DCE was the second most prevalent VOC detected in soil samples. In the saturated zone samples, cis-1,2-DCE concentrations ranged from a low of 0.00426 mg/kg to a high of 0.285 mg/kg. Vinyl chloride was detected in 11 samples above the MDL, with a range between 0.00456 mg/kg and 0.0103 mg/kg. The VOC 1,1-DCE was reported in 16 samples at concentrations that ranged from a low of 0.00188 mg/kg to a high of 0.00894 mg/kg.

Two of the samples, the shallowest samples from DPT-006 (0.0684 mg/kg) and DPT-011 (1.1 mg/kg) were collected from depths less than 23 ft bgs and are from the unsaturated zone. The DPT-011 sample had TCE concentrations that exceeded the GWP-Ind of 0.5 mg/kg. In addition to TCE, cis-1,2-DCE was detected in the two unsaturated zone samples at concentrations well below the GWP-Ind MSC. No other VOCs were detected in the unsaturated zone samples.

Fixed laboratory analytical results for the soil samples are presented in **Table 5**, while the raw analytical data packages and data validation report are provided in **Attachment 5**. Note: Soils were analyzed without dilution, and reanalyzed at dilution for high concentration analytes. The undiluted soil reporting limits (as Levels of Quantitation (LOQs)) were below the project action limits (PALs), which are the TCEQ GWP-Ind MSC. The laboratory data files provided in **Attachment 5** include additional details for the analyses, including sample-specific dilution factors, detection limits, limits of quantitation and detection, quality control samples and results, and other analytical information such as extraction and analysis dates.

3.1.2 2020 Soil Sample Results

Twenty seven soil borings were completed during the 2020 field effort. Four samples were collected from each boring with the exception of DPT-027 which had 6 samples collected. In total, 110 soil samples were collected and analyzed during the 2020 field effort. All soil samples were analyzed in a field laboratory for 8 selected VOCs using EPA method SW8260B. Ten samples were selected for fixed laboratory analysis by EPA Method SW8260B. Results for samples collected from the unsaturated zone (up to 23 ft bgs) were compared to the TCEQ soil MSCs for industrial use based on groundwater protection, GWP-Ind. The DPT boring locations expanded outward in all directions from the 2019 DPT locations, primarily to the north and east. The initial 2020 boring locations were selected based on the results from samples collected from the 2019 borings, and the subsequent locations were selected based on review of the field analysis results with concurrence of the regulators. The objective of these borings was to further define the extent of TCE contamination and to determine if the unsaturated soil (depths less than 23 ft bgs) overlying the historical high groundwater levels in the Shallow Zone in this area have been impacted. TCE is the target compound and is the primary focus of the discussion of results and represented in figures. The analytical results for the 2020 soil samples are provided in **Table 5** (fixed laboratory results) and **Table 6** (field laboratory results). The TCE results and boring locations are shown on **Figure 10**.

TCE and cis-1,2-DCE were the only analytes detected in the field laboratory results. Cis-1,2-DCE was detected in 6 unsaturated zone samples, with concentrations ranging from 0.034

mg/kg to 0.074 mg/kg, well below the GWP-Ind MSC of 7 mg/kg. TCE was detected in 20 unsaturated zone samples from 9 borings, with concentrations ranging from 0.027 mg/kg to 16 mg/kg. Ten of the reported concentrations from 5 borings exceeded the GWP-Ind MSC of 0.5 mg/kg.

DPT-013 was located within the existing extent of saturated zone TCE contamination determined based on the 2019 DPT results. The sample from 20-21 feet bgs had a TCE concentration of 0.5 mg/kg. This boring was located near DPT-007 that was completed in 2019, and showed one of the highest concentrations reported to date of 15.6 mg/kg at 31-32 ft bgs. DPT-012 and DPT-014 were also located within the previously identified area of contamination near Building 46A and were adjacent to previous saturated zone borings DPT-003 and DPT-011. TCE was not detected in the unsaturated zone samples from either of these borings. The 25-26 ft sample from DPT-014 showed TCE at 0.63 mg/kg, less than the concentrations reported in the DPT-011 samples from this depth range (between 1.1 mg/kg and 3.81 mg/kg). The results for DPT-013 indicated that there are TCE concentrations at the MSC in the unsaturated zone overlying higher TCE concentrations in the saturated zone.

Other borings with unsaturated zone sample exceedances included DPT-030 and DPT-031, both located to the southwest of Building 46A. The exceedances in DPT-030 occurred in samples collected from shallower depths, 16 mg/kg in the 10-11 ft bgs sample, and 7.9 mg/kg in the 15-16 ft bgs sample. TCE was not detected in the two deeper samples from this boring. DPT-031 was located further southwest of DPT-030 and Building 46A and showed increasing concentrations with depth, from .065 mg/kg and .027 mg/kg in the samples from 3-4 ft bgs and 12-13 ft bgs. The sample from 16-17 ft bgs showed TCE at 0.560 mg/kg, and the deepest sample from 21-22 ft bgs showed TCE at 2.0 mg/kg. These results extend the area of TCE contamination to approximately 100 ft to the south/southwest of Building 46A.

The remaining 2 borings that had unsaturated zone samples with TCE concentrations exceeding 0.5 mg/kg included DPT-028, and DPT-033, located east and northeast of Building 46A. The exceedances in these borings indicate that the extent of TCE contamination exceeding the GWP-Ind MSC extends approximately 200 ft further to the east/northeast of the previously defined extent. DPT-028 and DPT-033 had TCE concentrations greater than 0.5 mg/kg in one or two of the deepest samples from each boring, DPT-028 had TCE detected in all 4 samples, but only the two deepest samples from 16-17 ft bgs and 21-22 ft bgs samples had concentrations that exceeded 0.5 mg/kg (1.3 mg/kg and 3.3 mg/kg, respectively). DPT-033 had TCE reported at 0.52 mg/kg in the 19-20 ft bgs sample and 1.7 mg/kg in the 22-23 ft bgs sample.

The remaining outlying DPT borings in all directions from Building 46A did not have TCE detected or the reported concentrations in the unsaturated zone were less than 0.5 mg/kg, and the extent of TCE concentrations exceeding the GWP-Ind MSC of 0.5 mg/kg has been defined. The highest TCE concentrations reported in the unsaturated soil are orders of magnitude less than the EPA guidance that concentrations of chemicals in soil greater than 1% by mass or 10,000 mg/kg may indicate the presence of DNAPL (EPA, 1994). This indicates that there is not a point source of residual TCE DNAPL in the unsaturated zone, or that it is a small, localized area not located by the DPT borings.

Saturated zone samples were collected from 7 borings, and TCE was reported in 6 of these samples, the deepest samples from each boring, at concentrations ranging from 0.069 mg/kg to 15 mg/kg. The highest concentration of 15 mg/kg was reported in the 32-33 ft bgs sample from DPT-018. The unsaturated zone samples in this boring all had TCE detected at much lower concentrations (0.058 mg/kg to 0.47 mg/kg). Cis-1-2-DCE was also detected in 5 of these saturated zone samples, with concentrations ranging from 0.032 to 0.480 mg/kg. The TCE detected in these borings was the only sample where TCE was detected or was the highest concentration reported in each boring.

The unsaturated zone soil sample TCE results and contour showing the extent of GWP-Ind MSC exceedances are shown on **Figure 11** and the saturated zone TCE results are shown on **Figure 12**. The posted results on **Figure 11** and **Figure 12** are the highest reported field laboratory concentrations for each boring in the unsaturated and saturated zones, respectively. As shown on **Figure 11**, the extent of GWP-Ind MSC exceedances indicates an elongated area of contamination approximately 500 ft long extending from southwest of Building 46A to the northeast of the building. Most of the concentrations only slightly exceed the MSC, with a few isolated locations of higher concentrations (greater than 10 mg/kg). These isolated locations may represent source areas from spills, sumps, or dumping. An additional consideration is that the shape of the exceedance area follows the general direction of groundwater flow and indicates that the soil contamination may represent a smear zone of soil contamination that remained as groundwater levels dropped. The results for the outlying samples (e.g. DPT-030 and DPT-031) may also indicate there are additional sources of TCE southwest of Building 46A that had not been previously identified.

3.2 Groundwater Sample Results

During the 2019 and 2020 field activities, groundwater samples were collected from temporary wells and monitoring wells to confirm an anomalously high concentration of TCE reported in well 47WW25R, to define the extent of residual DNAPL, and to assess the extent of TCE concentrations around Building 46A. This data will be used to supplement the historical data, as necessary, and to re-assess TCE in Upper Intermediate Zone groundwater to inform the ROD prior to its finalization.

The groundwater results presented in this section have been compared to SDWA MCLs, where they exist. Where an MCL has not been promulgated, the TRRP Tier 1 Groundwater PCL (TRRP PCL) comparison levels were used.

3.2.1 Groundwater Elevations and Cross Sections

Geologic cross sections were prepared to represent the lithology of the Shallow and Intermediate Zones, contacts between lithologic units, depths where soil and groundwater samples were collected, and groundwater elevations for both zones. Cross sections were prepared for the long axis (A – A') of the plumes, traversing from the southwest to the northeast and smaller perpendicular cross sections traversing from the northwest to the southeast. The cross sections are shown in **Figure 13** through **Figure 16**. The cross sections show undulating discontinuous silty sand layers across the site, with clay and clay mixed with fine sand, silt, and sandy/silty mixtures, which is the dominant unit in the Shallow Zone. The undulant nature of the sand and clay units is especially evident between the contact between the Shallow Zone bottom clay and the underlying Upper Intermediate sand where the contact depth varies greatly. The

presence of groundwater in the Shallow Zone appears related to sandy units. Several shallow DPT borings and wells completed in the Shallow Zone were either dry or contained a minimal amount of water (i.e., less than one foot). These borings and/or wells were typically screened in, or mostly in, clay units. One example where the shallow zone was dry is DPT-023, where the shallow DPT boring was set across the very shallow sand and into the clay laminated sand, this boring was a very poor producer of groundwater and was left open overnight. It is believed that the groundwater came from the clay laminated sand zone and not the overlying silty sand, sand clay mixture, resulting in a lower water table. It is possible that there are confining conditions and that there is a vertical gradient as a result. This would explain the differences in measured water elevations. All Upper Intermediate Zone DPT borings and wells contained groundwater ranging in depth below ground surface between 26 and 29 ft bgs. Higher groundwater elevations in the Upper Intermediate Zone were associated with borings/wells where the Upper Intermediate Zone sand was encountered closer to the ground surface. The direction of groundwater flow is to the northeast in both the Shallow and Upper Intermediate Zones; generally in agreement with previous findings (**Figure 17** and **Figure 18**).

3.2.2 2019 Groundwater Sampling and Results

Groundwater samples were collected from all eleven DPT borings and wells 47WW25R and 47WW37 for VOC analysis, and from DPT borings DPT-001, DPT-005, and DPT-010, and well 47WW09 for 1,4-dioxane analysis. All groundwater samples analyzed for VOCs were tested using EPA method SW8260B, while the 1,4-dioxane samples were analyzed using EPA method SW8270D. All eleven DPT borings were screened across the sand-laminated clay underlying the Shallow Zone and into the Upper Intermediate Zone (C/UI) sand unit, confounding evaluation of the results and limiting the ability to determine whether contamination is present through the entire open interval or is from a more limited zone within the interval. Well 47WW25R was also screened across this sand-clay interval into the Upper Intermediate Zone causing the same limitations determining the source of the VOC contamination. Well 47WW37 is screened in the Intermediate Zone, solely, and does not present the same limitations when evaluating the sample results. Six VOCs were detected at varying concentrations, of these, 2 compounds (acetone and toluene) were detected at low estimated concentrations well below their respective TRRP PCL. The remaining four VOCs included cis-1,2-DCE, methylene chloride, TCE, and vinyl chloride. The compound 1,4-dioxane was detected in one of the four samples collected for analysis. The following discussion focuses on these four compounds and the 1,4-dioxane detection.

The VOC TCE was the most prevalent compound detected: all 14 samples analyzed had a detectable concentration above the MDL that exceeded the MCL of 5 µg/L. Concentrations ranged from a low estimated (J) value of 29 J µg/L to a high of 140,000 µg/L.

Well 47WW25R had the highest concentrations of TCE at 140,000 µg/L, confirming the sample result from this well during the 2018 PSI (HDR, 2019b). Well 47WW37 had a detected concentration of 190 µg/L, higher than the 29.4 µg/L detected in 2010. Well 47WW37 is located approximately 40 feet to the south of 47WW25R and is screened in the Intermediate Zone groundwater at 61 ft bgs. Boring locations with the highest detected concentrations included DPT-007 (77,000 µg/L), DPT-008 (36,000 µg/L), DPT-011 (22,000 µg/L), DPT-010 (18,000 µg/L), and DPT-005 (5,400 µg/L). Based on these results, the highest TCE groundwater concentrations appear to be centered on well 47WW25R and borings DPT-005, DPT-007, DPT-

008, DPT-010, and DPT-011. When comparing the groundwater to the soil TCE results, only soil samples taken from DPT-007, DPT-010, and DPT-011 had relatively high TCE concentrations (up to 15.5 mg/kg). However, even the highest concentrations of TCE in soil were much lower than the 10,000 mg/kg suggested threshold for the presence of DNAPL.

The VOC cis-1,2-DCE was detected in 12 samples, seven with concentrations that exceeded the MCL of 70.0 µg/L. Concentrations ranged from a low estimated value of 0.99 J µg/L to a high of 2,600 µg/L.

Well 47WW25R had the highest concentrations of cis-1,2-DCE at 2,600 µg/L, while well 47WW37 had a relatively low value of 13 µg/L. Boring locations with the highest detected concentrations included DPT-011 (1,500 µg/L), DPT-010 (13,000 µg/L), DPT-007 (840 J µg/L), and DPT-008 (820 µg/L). Based on these results, the highest cis-1,2-DCE groundwater concentrations appear to be centered on well 47WW25R and borings DPT-007, DPT-008, DPT-010, and DPT-011, similar to the TCE results. When comparing the groundwater to the soil cis-1,2-DCE results, soil samples taken from DPT-007, DPT-008, DPT-010, and DPT-011 all had relatively high cis-1,2-DCE concentrations. The detection of cis-1,2-DCE, and to a lesser extent vinyl chloride, suggest natural attenuation of TCE.

Methylene chloride was detected in seven samples at estimated concentrations, all of which had concentrations that exceeded the MCL of 5 µg/L. Concentrations ranged from a low estimated value of 6.1 J µg/L to a high of 210 µg/L.

Methylene chloride went undetected in well 47WW25R, while well 47WW37 had a detection of 6.1 J µg/L. Boring locations with the highest detected concentrations included DPT-008 (210 J µg/L), DPT-010 (200 J µg/L), DPT-005 (94 J µg/L), DPT-004 (24 J µg/L), and DPT-003 (23 J µg/L). Based on these results, the highest methylene chloride groundwater concentrations appear to be centered on borings DPT-003, DPT-004, DPT-005, DPT-008, and DPT-010, which has a farther areal extent than the cis-1,2-DCE and TCE plume. When comparing the groundwater to the soil methylene chloride results, only one soil sample taken from DPT-008 had a soil detection.

Vinyl chloride was only detected in the sample collected from boring DPT-010 at an estimated concentration of 97 J µg/L. This concentration exceeded the MCL of 2.0 µg/L. The compound 1,4-dioxane was only detected in well 47WW09 at a concentration of 37 µg/L, which exceeded the TRRP PCL of 9.1 µg/L. Samples collected from borings DPT-001, DPT-005, and DPT-010 did not have detectable concentrations above the MDL.

Fixed laboratory analytical results for TCE and its primary degradation products for the 2019 groundwater samples are presented in **Table 7**, while the raw analytical data package and data validation report are provided in **Attachment 5**. Note: For groundwater samples that were analyzed undiluted, the LOQs were below the PALs, MCL, and TRRP Groundwater PCL except for 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane, and 1,2-dibromoethane, as was noted in the data validation report.

Some of the groundwater samples were analyzed at dilutions, which resulted in LOQs for a number of analytes that were above the PALs. However, for all the samples analyzed at dilution, all had TCE results above the PALs, and some of the samples also had methylene chloride, cis-1,2-DCE, and/or vinyl chloride results above the PALs. The samples that were run at dilutions

had been previously analyzed at other dilutions and were reanalyzed at the reported dilutions because the TCE results were within the instrument's calibration curve.

3.2.3 2020 Groundwater Sampling and Results

Groundwater samples were collected from the temporary wells installed in the DPT borings, as well as from existing and newly installed monitoring wells during the 2020 field effort. As described in **Sections 2.2** and **2.3**, temporary wells were installed in all of the DPT borings except for DPT-038. Eight new monitoring wells were installed and sampled, and 6 existing monitoring wells were sampled. The samples collected from all of the temporary and existing monitoring wells were analyzed by EPA Method SW826B for a selected suite of 8 VOCs in the field laboratory. Samples from the newly installed monitoring wells and 4 selected temporary well samples were analyzed for VOCs by EPA Method SW826B in a fixed laboratory. The field laboratory groundwater sample results are presented in **Table 8** and the fixed laboratory results for TCE and its primary degradation products are presented in **Table 7**. **Figure 19** presents the TCE results for the Shallow Zone temporary well and monitoring well samples.

For the Shallow Zone samples, field laboratory results showed TCE, cis-1,2-DCE, trans-1,2-DCE, 1,1-DCE, PCE, and vinyl chloride were detected in one or more samples. PCE and trans-1,2-DCE were detected in 1 and 4 samples, respectively, and the reported concentrations did not exceed their MCLs. Methylene chloride was detected in one sample at 0.99 µg/L in 47WW48. Methlyene chloride was not detected in any other Shallow Zone monitoring well or temporary well samples. TCE and cis-1,2-DCE were detected most frequently. Thirteen of the temporary well samples and 3 of the existing monitoring well samples had TCE concentrations greater than the MCL of 5 µg/L. The detected TCE concentrations ranged from 6.6 µg/L to 120,000 µg/L. Four of the new monitoring wells are screened in the Shallow Zone (47WW48, 47WW49, 47WW52, and 47WW55) and the samples were analyzed at the fixed laboratory. The TCE concentrations reported in each of these wells also exceeded the MCL, ranging from 2,410 µg/L to 54,100 µg/L.

The highest reported TCE (120,000 µg/L) and cis-1,2-DCE (2,500 µg/L) were reported in 47WW25R, and are consistent with the previously reported concentrations. The other borings located in the immediate vicinity of 47WW25R also had TCE concentrations greater than 10,000 µg/L (DPT-014, 30 feet to the southeast, was dry and could not be sampled). DPT-013, located approximately 20 feet to the northwest had a TCE concentration of 57,000 µg/L, and new monitoring well 47WW49 located adjacent to DPT-013 had a TCE concentration of 10,200 µg/L. The other 2 borings near Building 46A and 47WW25R included DPT-026 (14,000 µg/L) and DPT-012 (21,000 µg/L). DPT-026 is located approximately 60 feet south of 47WW25R and DPT-012 is located approximately 100 feet west/southwest, on the other side of Building 46A.

The remaining DPT borings were placed farther away from Building 46A to define the extent of the TCE plume, and indicated additional possible hot spots or source areas distant from the initially identified hot spot. These include DPT-031 southwest of Building 46A that had a TCE concentration of 41,000 µg/L and DPT-029 to the northeast where TCE was reported at 22,000 µg/L. Monitoring well 47WW48 located adjacent to DPT-031 also had a high TCE concentration of 54,100, similar to the concentration reported in DPT-031. Other borings with TCE concentrations greater than 1,000 µg/L included DPT-027 (3,500 µg/L), DPT-023 (2,500 µg/L), DPT-033 (5,700 µg/L), and DPT-017 (3,000 µg/L). Shallow Zone monitoring well 47WW52, located approximately 50 feet northeast of DPT-023 had a similar TCE concentration of 5,990

µg/L. Monitoring well 47WW55, located adjacent to 47WW54 (Upper Intermediate Zone) and approximately 40 feet north of 47WW52 had a TCE concentration of 2,410 µg/L, indicating decreasing TCE concentrations farther north of the plume center around DPT-029, however concentrations still significantly exceed the MCL.

The overall results for the Shallow Zone temporary wells and monitoring wells show 3 distinct plumes with TCE concentrations greater than the MCL of 5 µg/L, separated by dry zones, as shown on **Figure 19.** The largest plume is centered on Building 46A, with two smaller plumes, one to the east and one north of Building 46A. In addition to indicating the extent of TCE concentrations greater than the MCL, the extent of the areas with TCE concentrations greater than 10,000 µg/L is shown on **Figure 19**. These areas may indicate the presence of residual DNAPL. As noted in *An Introduction to Characterizing Sites Contaminated with DNAPLs* (ITRC, 2003), "one indication of the presence of DNAPL in the saturated zone in a monitoring well with a long well screen (at least 10 ft long), is that the concentration of the contaminant is greater than one to ten percent (1-10%) of the compound's effective solubility." Based on this definition, the estimated DNAPL threshold concentration for TCE is 11,000 µg/L. While this "rule of thumb" is not a conclusive indication of DNAPL, recent concentrations of TCE indicate the potential presence of residual DNAPL. A concentration of 10,000 µg/L is being used as a conservative indicator of the possible presence of residual DNAPL. Based on this definition, there are also 3 separate areas of residual DNAPL in the Shallow Zone. The largest is centered on Building 46A, and the other two are each defined by a single location, DPT-031 to the southwest and DPT-029 to the northeast (**Figure 19**).

The Upper Intermediate Zone temporary wells installed during the 2020 field effort were all constructed as described in **Section 2.2** and are all considered to be isolated from the Shallow Zone and that the sample results to represent the Upper Intermediate Zone (not the C/UI). Although some of the well screens were placed within the C/UI, the exposed screen depths were in the sand unit below the confining clay to ensure that the samples would represent the Upper Intermediate Zone. For the Upper Intermediate Zone groundwater samples, results for the temporary wells and monitoring wells showed that TCE and cis-1,2-DCE were detected most frequently. PCE, 1,2-DCA, and methylene chloride were not detected in any of the field laboratory samples, including 47WW37 that had methylene chloride detected in 2019. Vinyl chloride was detected in one sample (DPT-017 at 7.80 µg/L), and trans-1,2-DCE was detected in 2 samples at concentrations less than the MCL. Some of the groundwater samples were analyzed at dilutions, which resulted in LOQs for a number of analytes that were above the MCLs. However, for all the samples analyzed at dilution, all had TCE results that exceeded the MCL.

The fixed laboratory results also showed TCE and cis-1,2-DCE were most frequently detected. 1,1-DCE was detected in 7 samples, with 1 sample exceeding the MCL of 7 µg/L (47WW48 – 25.4 µg/L). Vinyl chloride was detected in 5 samples, with one result exceeding the MCL of 2 µg/L (47WW48 – 5.93 µg/L). Additional VOCs were detected in the fixed laboratory samples, however most of the detections were in a single sample and none exceeded their respective MCLs or TRRP PCL. **Figure 20** presents the TCE results for the Upper Intermediate Zone temporary wells and monitoring wells.

Three of the highest TCE and cis-1,2-DCE concentrations in Upper Intermediate temporary or monitoring wells were reported in the same or nearby temporary wells that had high Shallow

Zone concentrations. TCE concentrations greater than 10,000 µg/L were reported in DPT-026 (40,000 µg/L) and DPT-029 (11,000 µg/L). Comparison of the Shallow and Upper Intermediate Zone concentrations indicate increasing concentrations with depth at DPT-029. The Upper Intermediate Zone concentrations were less than the corresponding Shallow zone concentrations in the other wells, however, all of these locations indicate the presence of residual TCE DNAPL in both the Shallow and Upper Intermediate Zones.

Three additional Upper Intermediate Zone temporary wells that were dry in the shallow zone had TCE reported greater than 10,000 µg/L, including DPT-018 (41,000 µg/L), DPT-022 (66,000 µg/L) and DPT-028 (11,000 µg/L). It is possible that since some of the shallow zone temporary wells were screened in tight clay soils that they may be been within the saturated zone, but that no water accumulated by the time sampling was attempted. The cis-1.2-DCE concentrations in all of these wells also exceeded the MCL. Collectively these results indicate a residual DNAPL plume that extends from the southeastern corner of Building 46A approximately 300 feet to the north/northeast. **Figure 20** shows the iso-concentration contour indicating the extent of residual TCE DNAPL in the Upper Intermediate Zone.

Six Upper Intermediate Zone temporary wells and 3 monitoring wells had TCE reported at concentrations between 1,000 µg/L and 10,000 µg/L. Three of these locations had no corresponding shallow temporary well samples because the Shallow Zone well was dry (DPT-020, DPT-021, and DPT-028). The remaining Upper Intermediate Zone locations had corresponding Shallow Zone samples. Two of these wells had higher TCE concentrations in the Upper Intermediate Zone than in the corresponding Shallow Zone samples (DPT-023, DPT-035). Concentrations decreased with depth at DPT-033.

Based on the results for the Upper Intermediate Zone temporary wells and monitoring wells, a TCE residual DNAPL plume can be defined except in the north and a small part of the boundary to the east, and the full extent of TCE concentrations that exceed the MCL of 5 µg/L is not bounded by locations where TCE was not detected or was less than 5 µg/L. SB01 and SB02 were borings completed during the initial PSI and these locations were used to bound the extent to the southwest and southeast. The samples from the two Upper Intermediate Zone monitoring wells north of DPT-023 had higher TCE concentrations reported, 5,540 µg/L in 47WW53 and 4,860 µg/L in 47WW54. These wells are located approximately 50 and 100 ft north of DPT-023, which had an Upper Intermediate Zone TCE concentration of 4,400 µg/L, indicating that the extent of TCE is unbounded to the north. **Figure 20** shows iso-concentration contours for TCE in the Upper Intermediate Zone.

There were limited data available for the Intermediate Zone. One existing well, 47WW37 was sampled to provide data for the Intermediate Zone. The TCE concentration was greater than the MCL, 180 µg/L in 47WW37. Monitoring well 47WW37 is located adjacent to 47WW25R, near Building 46A and near the presumed source of TCE. The TCE concentration was 180 µg/L, greater than the MCL but several hundred orders of magnitude less than the concentration reported in the C/UI Zone (120,000 µg/L in the 47WW25R sample). 47WW37 is screened between 56-66 ft bgs, approximately 20 feet deeper than the Upper Intermediate Zone wells. The detected TCE at this depth indicates that the TCE contamination has migrated to depth. Due to the much greater depth than the Upper Intermediate Zone wells, the TCE concentration for this well was not considered representative of the Upper Intermediate Zone and was not used to develop the TCE isoconcentration contours shown on **Figure 20**.

3.2.4 Field/Fixed Laboratory Data Comparison

Ten soil samples were analyzed by both the field and fixed laboratories. TCE was reported in 7 of the 10 samples, and 2 of the field laboratory samples, with the results for DPT-028 (5.88 mg/kg in the 16-17 ft bgs sample) and DPT-030 (59.6 mg/kg in the 10-11 ft bgs sample) exceeding the GWP-Ind MSC of 0.5 mg/kg. These results generally correlate with the field laboratory results for these borings, in that the field laboratory results for these samples also exceeded 0.5 mg/kg, however the field laboratory concentrations were both less than those reported by the fixed laboratory (1.3 mg/kg for DPT-028 and 16.0 mg/kg for DPT-030). The other detected TCE concentrations in the fixed laboratory samples were reported from DPT-029, DPT-021, DPT-020, and DPT-017 at concentrations ranging from 0.005 mg/kg to 0.324 mg/kg. TCE was not detected in any of the corresponding field laboratory samples for these samples. The differences in sample dilution between the fixed and field laboratory results influence the individual sample LOQs and is likely the cause for the difference in detected vs. undetected results. Cis-1,2-DCE was detected at concentrations ranging from 0.001 mg/kg to 0.467 mg/kg in 4 samples, from DPT-017, DPT-021, DPT-028, and DPT-030. All of these samples also had TCE detected, and all concentrations were well below the GWP-Ind MSC of 7.0 mg/kg. Two other VOCs, toluene and bromoform, were detected in one sample each, and the reported concentrations were well below the respective GWP-Ind MSCs.

The relative percent difference (RPD) was calculated for samples that had the analytes detected in both the fixed and field laboratory samples. The RPDs higher than 50% also reflect differences in dilution. **Table 9** presents a comparison of the paired field and fixed laboratory soil sample results.

Four temporary well groundwater samples were analyzed in both the field and fixed laboratory. **Table 10** presents the paired results for groundwater samples analyzed in both the field laboratory and fixed laboratory. TCE and cis-1,2-DCE were both detected in all of the sample pairs. Three of the field/fixed laboratory pairs had similar TCE concentrations, with RPDs less than 10%, while the fixed laboratory result was significantly higher in the samples from DPT-025 (1,510 µg/L vs. 660 µg/L). The cis-1,2-DCE results also showed generally good agreement. Vinyl chloride and methylene chloride were detected at concentrations less than 1 µg/L in the fixed laboratory sample from DPT-025 but were not detected in the field laboratory sample. In general, there was very good correlation between the field and fixed laboratory analytical results. There were several sample pairs where the correlation was lower, but can be attributed to the fixed laboratory analyzing additional diluted samples.

4.0 Investigation Summary

The results of the PSI No. 2 field results are summarized in the following discussion.

4.1 Shallow Zone Groundwater

The Shallow Zone groundwater table in the vicinity of Building 46A occurs at depths between approximately 25 ft bgs and 32 ft bgs. Temporary wells screened at depths shallower than 20 ft bgs were all dry, as were several of the wells screened at depths greater than 23 ft bgs (**Table 1**), the depth determined to represent the historical depth of the unsaturated/saturated zone interface. As shown on **Figure 19**, the dry temporary well locations separate the Shallow Zone TCE plume into 3 distinct plumes, separated by dry zones. Review of the boring logs for the dry wells shows that nearly all of these wells had screens set in the sand-laminated clay. DPT-018, DPT-022 and DPT-036 were the only locations that had screens set nearly exclusively in clay or silty clay, while the other dry locations had sand lenses logged at varying thicknesses. The largest Shallow Zone groundwater plume is centered on Building 46A, with two smaller plumes, one to the east and one to the northeast of Building 46A.

The extent of TCE contamination exceeding the MCL of 5 µg/L in the plume centered on Building 46A is fully defined. The plume is bounded by dry wells or locations with reported TCE concentrations less than the MCL or where TCE went undetected. Results for monitoring wells or soil borings sampled during the initial PSI in 2018 were used to help define the extent of this plume. The extent of the smaller plume to the east, encompassing DPT-033, DPT-017, and DPT-032 is defined except to the northeast. This plume may extend toward 47WW13, however LHSMW50 had a TCE concentration of 0.6 ug/L in 2018, indicating that the reported TCE in 47WW13 may be from a different source. The extent of the northern Shallow Zone plume is defined by dry temporary wells to the south, and 47WW24 to the north, but the extent of the plume in the other directions is not defined. The dry wells separating this plume (DPT-018, DPT-019, DPT-022, DPT-028, and DPT-036) from the other plumes were screened in the sand-laminated clay or in clay and silty clay. The clay-dominated soil conditions may explain the lack of water at these locations and it is possible that water would have been present if the wells had been open for a longer period before attempting to collect samples.

There are 3 areas of residual TCE DNAPL within the Shallow Zone, defined as TCE concentrations greater than 10,000 µg/L. The largest area is near Building 46A, with concentrations reported at 57,000 µg/L in temporary well DPT-013. A smaller area of residual DNAPL is defined within the larger TCE plume and southwest of Building 46A, centered on DPT-031 (41,000 µg/L) and 47WW48 (54,100 µg/L). The third, and smallest area of residual DNAPL is centered on DPT-029 (22,000 µg/L) within the northern Shallow Zone plume. The extent of these three residual DNAPL plumes are defined within the extent of the larger plumes exceeding the MCL. The TCE samples with concentrations indicative of residual DNAPL were taken from intervals with predominantly clay soils, with some interspersed sand lenses within the screened intervals.

4.2 Upper Intermediate Zone Groundwater

The Upper Intermediate Zone groundwater results indicate a single TCE plume defined by TCE concentrations exceeding 5 µg/L that extends from the southeastern corner of Building 46A

toward the north and east (**Figure 20**). The extent of the plume with concentrations exceeding the MCL is defined to the south and southwest, and is partially defined along the estimated northeastern boundary, but is not defined to the southeast, north, and northwest.

The results for 47WW25R and DPT-001 through DPT-011 may represent contamination at least partially contributed by a shallower source in the clay-dominated layer overlying the Upper Intermediate zone and are therefore considered separately from the results for the other Upper Intermediate Zone temporary and monitoring wells. All of these locations are within the larger TCE plume defined by other temporary wells and monitoring wells screened in the Upper Intermediate Zone. Concentrations in samples from 47WW25R and DPT-005, -007, -008, -010 and -011 all exceeded 5,000 µg/L; all except DPT-005 had sample concentrations exceeding 10,000 µg/L.

A single residual DNAPL plume is defined within the larger plume, and extends from DPT-026 in the south to DPT-028 and DPT-029 to the northeast and north. TCE concentrations in samples collected from these wells screened solely in the Upper Intermediate Zone ranged from 11,000 µg/L in DPT-028 and DPT-029 to 66,000 µg/L in DPT-022. Unlike the Shallow Zone residual DNAPL plumes, these results were reported in samples taken from the sand unit underlying the clay-dominated unit separating the Shallow and Upper Intermediate Zones. The estimated southern extent of the residual DNAPL is defined by DPT-026 with a TCE concentration of 40,000 µg/L.

One confounding result is for 47WW50, located near 47WW25R. This well is screened from 45 ft bgs to 50 ft bgs that had a TCE concentration of 471 µg/L, and is screened deeper than any of the C/UI wells (DPT-005, screen interval 24-34 ft bgs, and DPT-007, screen interval 26-36 ft bgs) in the vicinity. This result suggests that the dissolved phase concentrations from the residual DNAPL decrease with depth. This is supported by comparison with the concentration of 10,200 µg/L that was reported in nearby Shallow Zone well 47WW49 (screen interval 19-29 ft bgs).

The highest concentration of TCE that has been reported was from 47WW25R and several of the other highest concentrations were reported in samples from the nearby C/UI temporary wells as noted above. These combined results indicate the primary TCE source is centered in this area and has migrated to the northeast, consistent with the groundwater flow direction, however there is uncertainty about the depth of the source since the high concentrations in the Upper Intermediate Zone wells may reflect cross-contamination from the C/UI wells or long-term migration from the overlying clay unit.

4.3 Soil

The unsaturated zone soil results indicate an area of contamination with TCE concentrations exceeding the GWP-Ind MSC of 0.5 mg/kg (**Figure 11**) that generally overlies the extent of the Shallow Zone groundwater plume centered on Building 46A and the smaller plume to the northeast, trending from southwest of Building 46A to the northeast. The field laboratory sample results are shown on **Figure 11**, and represent the highest concentration reported in the unsaturated zone for each boring. The field laboratory results are shown since all samples were analyzed and provide a complete data set while the fixed laboratory analysis was performed for only a subset of samples. The extent of unsaturated soil contamination is defined by locations

where TCE was not detected or was less than 0.5 mg/kg. TCE concentrations for the soil exceedances ranged from 0.5 mg/kg to 16 mg/kg. Except for the high concentration of 16 mg/kg reported in DPT-030, all other exceedances ranged from 0.5 to 3.3 mg/kg. The shallow zone well at DPT-30 was dry, and no Upper Intermediate Zone well was installed, so no conclusion can be drawn about whether the high concentration in the unsaturated soil may have impacted groundwater.

The highest TCE concentrations reported in soil are orders of magnitude less than the EPA guidance that concentrations of chemicals in soil greater than 1% by mass or 10,000 mg/kg may indicate the presence of DNAPL (EPA, 1994). The reported TCE concentrations in both unsaturated and saturated soil do not identify a potential DNAPL source, indicating that the TCE source may be a small, localized point source not identified by DPT boring locations.

The unsaturated soil results indicate that TCE concentrations exceed the GWP-Ind MSC overlying a portion of the residual DNAPL plumes, but unsaturated soil TCE concentrations in the DPT borings with Shallow Zone groundwater concentrations indicative of residual DNAPL were not detected or were less than the MSC in DPT-012 and DPT-026, and 0.5 mg.kg in the DPT-013 sample. These three DPT borings define the extent of the Shallow Zone groundwater residual DNAPL plume near Building 46A. The unsaturated soil sample results were not detected for all depths sampled in DPT-029, the residual DNAPL location in the northern plume. The third area of residual DNAPL in groundwater is defined near DPT-031.The unsaturated soil concentrations in DPT-031 increased with depth to a maximum of 2 mg/kg in the 21-22 ft bgs sample. These results may indicate a potential source area that has impacted groundwater, however the soil concentration is still much lower than what would be expected to represent DNAPL in soil. The results for DPT-030 and DPT-031 may also indicate an additional source southwest of Building 46A that was not previously identified.

Since the overall extent of the unsaturated soil TCE contamination overlies a portion of the maximum extent of the Shallow Zone groundwater plumes, the area may be generally considered to reflect a dispersed source area, but the relatively low concentrations throughout the area do not indicate a significant point source that is impacting groundwater, and most exceedances are limited to depths just above the historical saturated depth or are isolated in lateral extent where exceedances are present at shallower depths.

Most of the highest (greater than 10 mg/kg) TCE concentrations reported in the saturated soils coincide with the Shallow Zone residual DNAPL plume extent around Building 46A (saturated soil results are shown on **Figure 12,** residual DNAPL plumes are shown on **Figure 19**). The field laboratory sample results are shown on **Figure 12**, and represent the highest concentration reported in the saturated zone for each boring. The field laboratory results are shown since all samples were analyzed and provide a complete data set while the fixed laboratory analysis was performed for only a subset of samples. Locations outside of this plume with higher saturated soil concentrations include DPT-001 at the northern end of Building 46A, just outside of the Shallow Zone residual DNAPL plume. The other saturated zone soil sample with the highest reported TCE concentrations was from DPT-018 to the northeast of Building 46A and overlies the Upper Intermediate Zone residual DNAPL plume. These isolated soil hot spot areas may be targeted for further investigation and possible remediation as part of the Remedial Design process.

Uniform depth of 23 ft below ground surface based on historical data is used to define the depth of the Unsaturated Zone.

NOTES:
Bold Results indicate concentration greater than GWP-Ind MSC of 0.5 mg/kg.
All units are in milligrams per kilogram (mg/kg)
TCE = ND indicates TCE was not detected at all depths
ft bgs = feet below ground surface NS = not sampled

U = not detected
[1] = GWP-Ind MSCs
Bolded result indicates exceedance of comparison level
mg/kg = milligrams per kilogram
J = estimated value
J+ = estimated value, possibly biased high
Refer to Attachment 5 for sample dilution factors
ft bgs = feet below ground surface

Bolded result indicates exeedance of comparison level
mg/kg - milligrams per kilogram
U = not detected
J = estimated value
J- = estimated value, biased low
PID = photo ionization detector

Qual = Final Data Qualifier
PPM = parts per million
Comparison Levels are TRRP GWP-Ind MSCs
Refer to Attachment 5 for sample dilution factors
ft bgs = feet below ground surface

Bold Exceeds Comparison Level
µg/L micrograms per liter
ft bgs Feet below ground surface
MCL Safe Drinking Water Act (SDWA) maximum contaminant level
U Not Detected
J Estimated value
PCL TRRP Protective Concentration Level for Residential Groundwater Use, November 2019
MCL Safe Drinking Water Act (SDWA) maximum contaminant level
C/UI Clay/Upper Intermediate
Qual Final Data Qualifier
Comparison levels are SWDA MCLs if established, otherwise the TRRP PCL is used

Refer to Attachment 5 for sample dilution factors

DATA VALIDATION AND USABILITY REPORT

VOLATILES by USEPA SW-846 Method 8260C
1,4-DIOXANE by SW-846 Method 8270D-SIM

Project: USACE Longhorn Army Ammunition Plant (LHAAP), Texas
Soils and Groundwaters – November 2019
Project/Task Number: 10097916 Task 8
Sample Data Package: 149511
Laboratory: CT Laboratories, Baraboo, Wisconsin
Sample Matrix: Groundwater and Soil
Sampling Dates: November 2019
Validation Guidelines: Project Quality Assurance Project Plan (QAPP) *(Final Quality Assurance Project Plan for Longhorn Army Ammunition Plant, Karnack, Texas [July 2014]*); United States Environmental Protection Agency (USEPA) *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods*, 3rd edition (SW-846), *General Data Validation Guidelines* (United States Department of Defense [DoD] Environmental Data Quality Workgroup [EDQW], February 09, 2018); and professional judgment
Validation Level: Stage 2BVM (100% of data) and Stage 3VM (10% of data)
The IDW water was not validated.
Data Reviewer: Lynn K. Lutz, HDR

SUMMARY

All laboratory data were acceptable with qualification. The IDW water was not validated.

I. SAMPLE RECEIPT / CHAIN OF CUSTODY

Samples were received within the correct temperature range of 0-6°C. The chains of custody (COCs) were filled out. No qualification was required.

II. HOLDING TIMES AND PRESERVATION

Holding time and preservation criteria were generally met except as discussed below.

VOCs in GW: Samples were analyzed within 14 days of collection. All samples were at pH <2 at the time of analysis. No qualification was required.

VOCs in Soil: Samples were collected using Terracore samplers and preserved in water with sodium bisulfate (two vials) and methanol (one vial). Samples were analyzed within 14 days of collection.

1,4-Dioxane: Samples were extracted within seven days of collection and analyzed within 40 days of extraction. No qualification was required.

III. INSTRUMENT PERFORMANCE

VOCs in GW: GC/MS BFB tuning criteria were met. Sample analysis began within 12 hours of BFB analysis. No qualification was required.

VOCs in Soil: GC/MS BFB tuning criteria were met. Sample analysis began within 12 hours of BFB analysis. No qualification was required.

1,4-Dioxane: GC/MS DFTPP tuning criteria were met. Sample analysis began within 12 hours of DFTPP analysis. No qualification was required.

IV. INSTRUMENT CALIBRATION

INITIAL CALIBRATIONS

VOCs in GW: The calibration curve included a standard at or below the LOQ. Calibration requirements were met. No qualification was required.

VOCs in Soil: The calibration curve included a standard at or below the LOQ. Calibration requirements were met. No qualification was required.

1,4-Dioxane: The calibration curve included a standard at or below the LOQ. Calibration requirements were met. No qualification was required.

SECOND SOURCE STANDARDS (ICV)

VOCs in GW: All reported analytes had percent difference (%D) values less than 20% except bromomethane in one ICV, with a %D of 20.5%. No qualification was required.

VOCs in Soil: All reported analytes had %D values less than 20%. No qualification was required.

1,4-Dioxane: 1,4-Dioxane had %D values less than 20%. No qualification was required.

CONTINUING CALIBRATIONS

VOCs in GW: Several analytes had %D values above the 20% limit, but all associated sample results were non-detect and no qualification was required.

VOCs in Soil: Several analytes had %D values above the 20% limit (for opening CCVs) or the 50% limit (for closing CCVs) and associated samples were qualified as noted in the table.

CCV	Analyte	%D	Associated Samples	Qualifier
11/13/19 07:43	Bromomethane	-26%	All soils except: DPT-001 (27-28) DPT-002 (26-27)	UJ
11/14/19 08:19	Bromomethane	-32%	DPT-002 (32-33) DPT-002 (40-41) DPT-003 (29-30) DPT-009 (24-25)	

1,4-Dioxane: 1,4-Dioxane had %D values less than 20%. No qualification was required.

V. BLANKS

METHOD BLANKS (MB)

Target analytes were not detected in the method blanks except as noted below.

VOCs in GW: A trace level of p-isopropyltoluene was detected in one water blank (166500), but this analyte was non-detect in all associated samples and no qualification was required.

VOCs in Soil: VOCs were not detected in the method blanks. No qualification was required.

1,4-Dioxane: 1,4-Dioxane was not detected in the method blanks. No qualification was required.

TRIP BLANKS (TB)

VOCs in GW: Acetone was detected at trace levels in two trip blanks (TB-002 and TB-003). Acetone was only detected in one GW sample (DPT-009) at a trace level and has been qualified as estimated with a possible high bias (J+).

A trace level of p-isopropyltoluene was detected in one trip blank (TB-001), but this analyte was non-detect in all associated samples and no qualification was required.

A trace level of methylene chloride was detected in one trip blank (TB-003), but this analyte was non-detect in all associated samples and no qualification was required.

VOCs in Soil: Acetone was detected at trace levels in two trip blanks (TB-002 and TB-003). Acetone was detected in several associated soil samples (DPT-001 [31-32], DPT-003 [29-30], DPT-003 [39-40], DPT-004 [32-33], DPT-009 [24-25], and DUP-001) at trace levels and has been qualified as estimated with a possible high bias (J+).

A trace level of p-isopropyltoluene was detected in one trip blank (TB-001), but this analyte was non-detect in all associated samples and no qualification was required.

A trace level of methylene chloride was detected in one trip blank (TB-003), but this analyte was non-detect in all associated samples and no qualification was required.

1,4-Dioxane: Not applicable.

EQUIPMENT RINSE BLANKS (EB)

VOCs in GW: Acetone was detected at trace levels in all three EBs. Acetone was only detected in one GW sample (DPT-009) at a trace level and has been qualified as non-detect estimated (UJ).

VOCs in Soil: Acetone was detected at trace levels in all three EBs. Acetone was detected in several associated soil samples (DPT-001 [31-32], DPT-003 [29-30], DPT-003 [39-40], DPT-004 [32-33], DPT-009 [24-25], and DUP-001) at trace levels and has been qualified as estimated with a possible high bias (J+).

1,4-Dioxane: 1,4-Dioxane was not detected in the EB. No qualification was required.

VI. LABORATORY CONTROL SAMPLES (LCS)

VOCs in GW: LCS recoveries were within control limits. No qualification was required.

VOCs in Soil: LCS recoveries were within control limits. No qualification was required. LCS recoveries were within control limits. No qualification was required.

1,4-Dioxane: LCS recoveries were within control limits. No qualification was required.

VII. SURROGATES

All surrogate recoveries were within control limits except as noted below.

VOCs in GW: Surrogate recoveries were within control limits. No qualification was required.

VOCs in Soil: Surrogate recoveries were within control limits. No qualification was required.

1,4-Dioxane: The recoveries of the surrogate 1,4-dioxane-d8 in samples DUP-006 and 47WW25R-38 at 49% and 42% respectively were below the control limits of 50-150%. The 1,4-dioxane results in these samples were qualified as non-detect estimated (UJ).

VIII. MATRIX SPIKE / MATRIX SPIKE DUPLICATE (MS/MSD)

VOCs in GW: Samples DPT-002 and 47WW25R-35 were designated on the COC for MS/MSD analysis. Some results were outside control limits and the parent samples required qualification as shown below.

Parent Sample	Analyte	Recoveries (RPD)	Control Limits	Qualifier
DPT-002	n-Butylbenzene	OK, 129%	75-128%	None - ND
	sec-Butylbenzene	128%, 130%	77-126%	None – ND

Parent Sample	Analyte	Recoveries (RPD)	Control Limits	Qualifier
	Trichloroethene	150%, 61% (RPD 23%)	79-123% (RPD 20%)	J
47WW25R-35	cis-1,2-Dichloroethene	OK, 26% (RPD 163%)	78-123% (RPD 20%)	J

VOCs in Soil: Samples DPT-009 (31-32) and DPT-006 (30-31) were designated on the COC for MS/MSD analysis. Some results were outside control limits and the parent samples required qualification as shown below.

Parent Sample	Analyte	Recoveries (RPD)	Control Limits	Qualifier
DPT-009 (31-32)	1,2,3-Trichlorobenzene	24%, 63% RPD 90%	66-130% RPD 20%	UJ
	1,2,3-Trichloropropane	RPD 25%	RPD 20%	J
	Naphthalene	20%, 56% RPD 90%	62-129% RPD 20%	UJ
	1,2,4-Trichlorobenzene	33%, OK RPD 77%	67-129% RPD 20%	UJ
	1,2-Dibromo-3-chloropropane (DBCP)	51%, OK RPD 68%	61-132% RPD 20%	UJ
	1,2-Dichlorobenzene	61%, OK RPD 45%	78-121% RPD 20%	UJ

1,4-Dioxane: 47WW25R-35 was designated on the COC for MS/MSD analysis. The recoveries and RPD were within control limits. No qualification was required.

IX. DUPLICATES

FIELD DUPLICATES

Field duplicate samples were collected as identified in the following table.

Field Duplicate Sample	Parent Sample	Matrix - Analysis
Dup-001	DPT-009 (31-32)	Soil – VOCs
Dup-002	DPT-006 (30–31)	Soil – VOCs

Field Duplicate Sample	Parent Sample	Matrix - Analysis
Dup-003	DPT-010 (32-33)	Soil – VOCs
Dup-004	DPT-002	GW – VOCs
Dup-005	47WW25R-35	GW – VOCs
Dup-006	47WW25R-35	GW – 1,4-Dioxane

RPDs were within control limits except as noted below.

VOCs in GW: RPDs were within control limits. No qualification was required.

VOCs in Soil: In the DPT-010 (32-33) / DUP-003 pair, vinyl chloride had an RPD of 31%, above the control limit of 20%. This analyte in these two samples has been qualified as estimated (J).

1,4-Dioxane: The target analyte was non-detect in both samples. No qualification was required.

LABORATORY DUPLICATES

VOCs in GW: Not applicable.

VOCs in Soil: Not applicable.

1,4-Dioxane: Not applicable.

X. INTERNAL STANDARDS (ISTD)

All ISTD criteria were met except as noted below.

VOCs in GW: All ISTD criteria were met. No qualification was required.

VOCs in Soil: All ISTD criteria were met. No qualification was required.

1,4-Dioxane: All ISTD criteria were met. No qualification was required.

XI. LIMITS OF QUANTITATION (LOQs), LIMITS OF DETECTION (LODs), AND DETECTION LIMITS (DLs)

The LOQs should be at or below the project action limits (PALs) as listed in the QAPP.

VOCs in GW: The LOQs were generally at or below the PALs listed in the QAPP. The chart below shows the LOQs that were above PALs.

Analyte	LOQ (µg/L)	LOD (µg/L)	DL (µg/L)	MCL (µg/L)	TCEQ GW-Ind MSC (µg/L)
1,2,3-Trichloropropane	1.0	0.60	0.30	--	0.041
1,2-Dibromo-3-chloropropane (DBCP)	1.0	0.60	0.25	0.2	0.2
1,2-Dibromoethane (EDB)	1.0	0.60	0.30	--	0.05

VOCs in Soil: All LOQs were below the PALs listed in the QAPP.

1,4-Dioxane: The LOQ of 2.0 µg/L was below the PAL of 9.1 µg/L (the TRRP $^{GW}GW_{Ing}$ PCL).

XII. SAMPLE RESULTS / TRANSCRIPTION VERIFICATION

Transcription between the data package and the EDDs was verified. Non-detect sample results were reported to the LOD, but detections below the LOD were reported. Sample results detected between the DL and LOQ were qualified as estimated (J).

VOCs in GW: No issues.

VOCs in Soil: No issues.

1,4-Dioxane: No issues.

XIII. DATA USABILITY

Data were usable as discussed below.

VOCs in GW: No data were rejected. Data required minimal qualification. All data are usable as qualified.

VOCs in Soil: No data were rejected. Data required minimal qualification. All data are usable as qualified.

1,4-Dioxane: No data were rejected. Data required minimal qualification. All data are usable as qualified.

ANALYTICAL SUMMARY REPORT

This report at a minimum contains the following information:

Analytical Report of Test Results
Description of QC Qualifiers
Chain of Custody (copy)
Quality Control Summary (if applicable)
Case Narrative (if applicable)
Correspondence with Client (if applicable)

This report has been specifically prepared to satisfy project or program requirements. These results are in compliance with NELAC requirements for parameters where accreditation is required or available, unless otherwise noted in the case narrative.

Unless specifically stated to the contrary, soil/sediment/sludge sample results reported on a Dry Weight Basis

Unless specifically stated to the contrary, soil/sediment/sludge sample results reported on a Dry Weight Basis

Notes:

^ Indicates the laboratory is NELAP accredited for this analyte by the indicated matrix and method. DL (detection limit), LOD (limit of detection), loq (limit of quantitation) as defined by most recent DOD QSM version.

All samples were received intact and properly preserved unless otherwise noted. The results reported relate only to the samples tested. This report shall not be reproduced, except in full, without written approval of this laboratory. The Chain of Custody is attached.

Submitted by: Eric T. Korthals
Project Manager
608-356-2760

This report has been specifically prepared to satisfy project or program requirements. These results are in compliance with NELAC requirements for the parameters where accreditation is required or available, unless noted in the case narrative.

QC Qualifiers

Code	Description
B	Analyte detected in the associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
I	Incubator temperature was outside acceptance limits during test period.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was below detection limit.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Specified calibration criteria was not met.

delivering more than data from your environmental analyses

ANALYTICAL RESULTS FOR:

LYNN LUTZ
HDR
9563 S. KINGSTON COURT
ENGLEWOOD, CO 80112

PROJECT SITE:	Longhorn AAP, Karnack, TX
WORK ORDER/CONTRACT #:	
PROJECT #:	10097916
SDG:	149511
PREPARED:	December 9, 2019
DOCUMENT PAGES:	2616

The data contained in the following report have been reviewed by the appropriate CT Laboratories' LLC staff members. In addition, CT Laboratories LLC certifies that to the best of our knowledge that the analyses reported herein are true, complete and correct within the limits of the methods employed and that they follow the applicable requirements as specified by the project plan, state-specific, NELAC or DOD QSM requirements. The estimated uncertainty of measurement is only available upon request. The reported results relate only to the tested samples. This report shall not be reproduced, except in full, without written approval of CT Laboratories LLC.

CT LABORATORIES

delivering more than data from your environmental analyses

Case Narrative

Client: HDR, Englewood, CO
Project: Longhorn AAP, Karnack, TX
Sample Receipt Date(s): 11-11-2019
SDG #: 149511

Thirty-five soils were analyzed for VOCs and twenty-one aqueous samples were analyzed for a variety of analyses, including: 1,4-dioxane and VOCs. One solid IDW sample was analyzed for pH, flashpoint, reactive and sulfide, TCLP RCRA metals, TCLP SVOCs, TCLP pesticides, TCLP herbicides, and TCLP VOC's. Three trip blanks were included with the VOC analyses. The assigned sample ID numbers, date sampled, and date received are indicated in the attached Project Summary. The samples were received intact and the samples at a temperature within method specified acceptance limits. Any exceptions are noted below. The analyses were performed, where applicable, following QSM 5.1 requirements.

Manual integrations may have been performed on the data provided with this package. If manual integrations were performed, Reason #(s) were included on the raw data that corresponds to the "Index Key for Manual Integration Rationale." The raw data includes a "Before" and "After" manual integration illustration. The manual integrations were initialed and dated by the analyst, as well as, by the person reviewing the data.

Sample Analysis and Quality Control

Volatile Analysis:

The samples were analyzed using US EPA Method 8260C (VOCs). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Surrogate Recovery Data
Matrix Spike/Matrix Spike Duplicate Recovery Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log
Chromatograms

All analysis results met the method specified quality control criteria with the following exceptions:

Detailed reports were provided for the 8260 data for all detected compounds, as well as, for those compounds manually integrated (if applicable). Compounds not reported on the form 1's were either not detected or did not meet identification criteria so they were reported as non-detects.

Compounds that may not meet the recommended minimum average response factor (ARF) criteria for 8260C (such as several of the ketones) are analyzed at concentrations 2 to 50 times higher than normal to make up for their lack of response. However, the ARF on the response factor (RF) forms do not reflect this change in concentration. These compounds may be "flagged" on RF forms as a result.

Continuing Calibration Verification (CCV) compounds are calibrated using either response factor (with acceptance criteria <20%deviation, or <50% deviation for CCVF) or quadratic regression (with acceptance criteria <20% drift, or <50% drift for CCVF). Non-conformances were qualified with a "Z" flag unless otherwise noted.

VOC (8260C) TCLP Analysis

Analytical Run # 167058

All analytical results for this run met the method/project specified quality control criteria.

VOC (8260C) Aqueous Analyses

Analytical Run # 166500

CCV1 had a high recovery outside of specified criteria for sec-butylbenzene.

The Matrix Spike (MS) for sample # 356207 on run # 166500 had high recoveries for sec-butylbenzene and trichloroethene. The Matrix Spike Duplicate (MSD) for this sample had high recoveries for n-butylbenzene and sec-butylbenzene and a low recovery for trichloroethene. The parent sample result for these compounds was qualified with an "M" flag. The MS/MSD also had a Relative Percent Difference (RPD) failure for trichloroethene. The parent sample result for this compound was qualified with a "Y" flag.

Analytical Run # 166501

CCV2 had high recoveries outside of specified criteria for n-butylbenzene and sec-butylbenzene.

The MS and the MSD for sample # 356227 had multiple high recoveries. The parent sample results for the failing compounds were qualified with an "M" flag. The MS/MSD also had RPD exceedances for 1,2-dichlorobenzene and c-1,2-dichloroethene. The parent sample result for these compounds was qualified with a "Y" flag.

VOC (8260C) Low-level Solid Analyses

Analytical Run # 166497

CCV3 had high recoveries outside of specified criteria for dichlorodifluoromethane and methylene chloride and a low recovery for bromomethane.

The Matrix Spike (MS) and/or the Matrix Spike Duplicate (MSD) for sample # 356181 had multiple recovery failures. The parent sample results for the failing compounds were qualified with an "M" flag. The MS/MSD also had a number of compounds exceeding Relative Percent Difference (RPD) limits. The parent sample results for the compounds with RPD failures were qualified with a "Y" flag.

The samples with compounds exceeding the calibration range of the low level analyses were reanalyzed using the Methanol (MeOH) preserved samples. The QC associated with the targeted compounds for MeOH reanalysis was acceptable.

The samples that did not purge efficiently or contained suspected carry over during the initial analyses were reanalyzed.

Analytical Run # 166498

CCV2 had a low recovery outside of specified criteria for bromomethane.

CCV3 had high recoveries outside of specified criteria for dichlorodifluoromethane and methylene chloride and a low recovery for bromomethane.

The MS for sample # 356185 had low recoveries for 1,2-dichlorobenzene, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, and naphthalene. The MSD for this sample had low recoveries for 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and naphthalene and high recoveries for 1,2,3-trichloropropane and methylene chloride. The parent sample result for these compounds was qualified with an "M" flag.

The samples with compounds exceeding the calibration range of the low level analyses were reanalyzed using the Methanol (MeOH) preserved samples. The QC associated with the targeted compounds for MeOH reanalysis was acceptable.

The samples that did not purge efficiently or contained suspected carry over during the initial analyses were reanalyzed.

Semi-volatile Analysis:

The samples were analyzed using US EPA Method 8270D (SVOC SIM mode for 1,4-dioxane and full scan for TCLP analytes). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Surrogate Recovery Data
Matrix Spike/Matrix Spike Duplicate Recovery Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log
Chromatograms

All analysis results met the method specified quality control criteria with the following exceptions:

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target compounds within the calibration range of the instrument.

Samples suspected of being poorly purged, improperly prepped, mis-injected, or potentially contaminated from carryover were reanalyzed and reported accordingly.

Detailed reports were provided for the 8270 data for all detected compounds, as well as, for those compounds manually integrated (if applicable).

SVOCs (8270D) TCLP Analyses

Analytical Run #161315

The TCLP leach vessel blank appeared to be contaminated. No TCLP analytes were detected in the TCLP leach vessel blank. All analysis results for this SDG met the method/project specified quality control criteria.

SVOCs (8270D-SIM) 1,4-Dioxane Aqueous Analyses

Analytical Run #166715

These samples had matrix interference affecting the surrogate 1,4-dioxane-d8 primary quant ion of 96. The samples were processed using a quant ion of 64 for surrogate 1,4-dioxane-d8.

Samples 356226 and 356228 had low recoveries of surrogate standard 1,4-dioxane-d8. These surrogates were qualified with "S".

Pesticide/Herbicide Analyses:

The samples were analyzed using US EPA Methods 8081B (pesticides) and 8151A (herbicides). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Surrogate Recovery Data
Matrix Spike/Matrix Spike Duplicate Recovery Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log
Chromatograms

All analysis results met the method specified quality control criteria with the following exceptions:

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target compounds within the calibration range of the instrument.

Samples suspected of being poorly purged, improperly prepped, mis-injected, or potentially contaminated from carryover were reanalyzed and reported accordingly.

Pesticides (8081B) TCLP Analyses

Analytical Run #166876

LCS 360324 had a high recovery of endrin. This analyte was qualified with "Q" in the associated samples. The MS was analyzed on a sample from a different SDG.

Herbicides (8151A) TCLP Analyses

Analytical Run # 166947

All analysis results for this SDG met the method/project specified quality control criteria.

Metals:

The samples were analyzed using US EPA Methods 6010C (ICP) and 7470A (Hg). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

All analysis results met the method specified quality control criteria with the following exceptions:

Continuing Calibration Verifications standards were analyzed at two levels (CCV1 & CCV2) with potentially differing wavelengths. Data associated with CCV's were evaluated based on the concentration of the element in the samples and compared to the appropriate CCV level/wavelength. Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

ICP Metals (6010C) TCLP Analysis

Analytical Run # 166766

Barium was detected in the Method Blank (MB) greater than the absolute value of the Method Detection Limit (MDL) but less than ½ the Reporting Limit (RL). The sample was reported and not qualified because the MB result was less than $1/10^{th}$ of the sample result.

The Matrix Spike (MS) and/or Matrix Spike Duplicate (MSD) for sample # 356218 had failing recoveries for arsenic, cadmium, selenium, and silver. A Serial Dilution (L) was analyzed and was not applicable for arsenic, cadmium, selenium, and silver because the parent sample raw results were less than 50 times the Limit of Quantitation (LOQ). A Post Digestion Spike (PDS) was analyzed and was not acceptable for selenium. The parent sample was reported and qualified with an "M" flag for the failing element.

The Duplicate (DUP) for sample # 356218 was not applicable for arsenic, cadmium, chromium, lead, selenium, and silver because the parent sample results were less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

CVAA Mercury (7470A) TCLP Analysis

Analytical Run # 164096

The DUP for sample # 356218 was not applicable for mercury because the parent sample result was less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

The MSD for sample # 356218 had a failing recovery. The parent sample was reported and qualified with an "M" flag.

Inorganics:

The samples were analyzed using US EPA Methods SW846 Chapter 3 (reactive sulfide and cyanide), 1010 (flashpoint) and 9045D (pH). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

All analysis results met the method specified quality control criteria with the following exceptions:

Flashpoint (1010) Solid Analyses

Analytical Run # 166449

All analytical results for this run met the method/project specified quality control criteria.

pH (9045D) Solid Analyses

Analytical Run # 166453

All analytical results for this run met the method/project specified quality control criteria.

Reactive Cyanide (SW846 Chpt3) Solid Analyses

Analytical Run # 166589

All analytical results for this run met the method/project specified quality control criteria.

Reactive Sulfide (SW846 Chpt3) Solid Analyses

Analytical Run # 166583

All analytical results for this run met the method/project specified quality control criteria.

Data Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was not above the detection level.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

CT LABORATORIES

delivering more than data from your environmental analyses

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

VOLATILE ORGANICS ANALYSIS

Sample Description

DPT-004 (28-29)

Lab Name:	CT Laboratories	Contract:	HDR, INC-LONGHORN
Matrix:	SOIL	SDG No.:	149511
Sample wt/vol:	5.64 (g/mL)	CTL Sample ID:	356194
% Solids:	84.0	Date Received:	11/11/2019
Soil Extract Vol:	5.0 (mL)	Date/Time Prepared:	11/12/2019 / 10:40
Analytical Method:	EPA 8260C	Analytical Prep Batch #	74483
Analytical Run #:	166498	Dilution Factor:	2.00
Date & Time Analyzed:	11/18/2019 / 23:04	GPC Cleanup Date/Time:	/
TCLP / SPLP / MLP or ASTM Procedure Extraction Date (*if applicable*):			/
ICAL Calibration #:	LS111219	Concentration Units:	ug/kg

CAS NO.	Analyte	Concentration	Qualifiers	DL	LOD	LOQ	RL
79-01-6	Trichloroethene	8370		42	110	220	220

VOLATILE ORGANICS ANALYSIS (MB or CCB)

Sample Description: **CCB**

Lab Name:	CT Laboratories	Contract:	HDR, INC-LONGHORN
Matrix:		SDG No.:	149511
Sample wt/vol:	(g/mL)	CTL Sample ID:	366535
% Solids:		Date Received:	11/11/2019
Soil Extract Vol:	(mL)	Date/Time Prepared:	/
Analytical Method:	EPA 8260C	Analytical Prep Batch #	0
Analytical Run #:	166498	Dilution Factor:	1.00
Cleanup Date/Time/Type:	. . ,		
TCLP / SPLP / MLP or ASTM Procedure Extraction Date (*if applicable*):		/	
ICAL Calibration #:	LS111219	Concentration Units:	mg/kg

LCS

SOIL VOLATILE LAB CONTROL SAMPLE

Lab Name: CT Laboratories Contract: HDR, INC-LONGHORN

Sample No.: 357003 SDG No.: 149511

Analytical Method: EPA 8260C Concentration Units: ug/kg

Sample No.: 357003 Parent Sample No.: 0

Analytical Prep Batch #: 74483 Analytical Preparation Date/Time: 11/12/2019 10:40

Analytical Run #: 166498 ICAL Calibration #: LS111219

Analyte	Analysis Date/Time		Control Limit (%R)	Spike Result	Parent Result	Spike Amount	%R
Styrene	11/13/2019	08:12	76-124	9.00		10.0	90
tert-Butylbenzene	11/13/2019	08:12	73-125	8.80		10.0	88
Tetrachloroethene	11/13/2019	08:12	73-128	8.50		10.0	85
Toluene	11/13/2019	08:12	77-121	8.70		10.0	87
trans-1,2-Dichloroethene	11/13/2019	08:12	74-125	8.60		10.0	86
trans-1,3-Dichloropropene	11/13/2019	08:12	71-130	9.30		10.0	93
Trichloroethene	11/13/2019	08:12	77-123	8.80		10.0	88
Trichlorofluoromethane	11/13/2019	08:12	62-140	9.10		10.0	91
Vinyl acetate	11/13/2019	08:12	50-151	90.7		100	91
Vinyl chloride	11/13/2019	08:12	78-124	8.80		10.0	88
