Dilutions: Field sample 1907867001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

Method QC data: The method blank (LMB 645533) was less than 1/2 the CRDL. The recovery for the LCS (645534) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on sample 1907869001 (Client ID's: LH18/24-SP650_031419_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD percent recoveries and relative percent difference (RPD) were within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 645531) is reported from the analysis of the Laboratory Control Sample (LCS – 645534) at a level of 4.0µg/L. Due to limitations of the Chemstation Software, some of the chromatographic peaks may require manual integrations. A manual integration was performed for one of the Initial Calibration analyses (datafile: 19MARI03).

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◓ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\28MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 03/19/2019, sequence 19MAR19D.s Offline Quantitation Method: CLO4-DP2.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 6 Injection Volume: 25µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 645534; Target = 4.0µg/L. ASTM type II water was used for LMB 645533.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on sample 1907869001 (Client ID's: LH18/24-SP650_031419_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:
1) Results reported in µg/L. Field sample 1907867001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\MAR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\235529-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 645531) is reported from the analysis of the Laboratory Control Sample (LCS – 645534) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 19MARI03).

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2230 HBN: 235529 Sample Set IDs if Applicable: 1907867/1907869/1907871/1907894	Analyst Initials	Reviewer Initials

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Maintenance of Certification:
The real-time, long term stability of the RM may be monitored over the lifetime of the certification. If substantive changes occur that affect the certification before the expiration of this certificate, ULTRA Scientific will notify the purchaser.

S 43659

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)
Included on ISO/IEC 17025 Scope of Accreditation: Yes
Included on ISO 17034 Scope of Accreditation: Yes

GHS

Signal Word: None

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.
The final solution was checked against an independent standard to verify its concentration.
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.
All solutions are filtered through a 0.2 µm filter prior to being bottled.
All glassware used in preparation is Class A and calibrated regularly.
All weights are traceable through NIST, Test No. 822-275872-11
All bottles are triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.
We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

23118

Product Name: (Isotopic Label & Enrichment Specification)	PERCHLORIC ACID, SODIUM SALT (18O4, 90%+) 100 UG/ML IN WATER
Lot Number:	SDDG-013
Catalog Number:	OLM-7310-S

Product Information

Chemical Purity Specification:	≥98%
Labeled CAS Number:	NA
Unlabeled CAS Number:	7601-89-0
MW*:	130.4
Chemical Formula:	NaCl*O4
Storage:	Store at room temperature away from light and moisture.
Stability:	See storage and expiration date.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

Calibration Table

Perchlorate

Calib. Data Modified : 3/19/2019 2:35:19 PM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 20.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 20.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

Lakewood, CO 80228

Work Order: **HS19031160**

Laboratory Results for: **LH18/24 Longhorn GW Treatment Plant Weekly Samples**

Dear Marcia,

ALS Environmental received 2 sample(s) on Mar 22, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1907867; 1907869; 1907871; 1908794

Client: ALS Laboratories (Houston, TX)
Matrix: Water
ELMS Batch (HBN): 2230 (235529)

General Set Information: There were four field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard (ISTD) of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 10.0mL aliquot of each sample was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Phenex PES membrane 0.45µm Syringe filters.

Holding Times: Holding times were met for all analyses.

Dilutions: Field sample 1907867001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

Method QC data: The method blank (LMB 645533) was less than 1/2 the CRDL. The recovery for the LCS (645534) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on sample 1907869001 (Client ID's: LH18/24-SP650_031419_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD percent recoveries and relative percent difference (RPD) were within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 645531) is reported from the analysis of the Laboratory Control Sample (LCS – 645534) at a level of 4.0µg/L. Due to limitations of the Chemstation Software, some of the chromatographic peaks may require manual integrations. A manual integration was performed for one of the Initial Calibration analyses (datafile: 19MARI03).

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Testing Sector	Accreditation Body (Standard)	Certificate Number	Website
Environmental	PJLA (DoD ELAP)	L17-506	http://www.pjlabs.com
	PJLA (ISO 17025)	L17-507-R1	http://www.pjlabs.com

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Comments

Field sample 1907867001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

QC Report Authorization (/S/ is an electronic signature that complies with 21 CFR Part 11)

Analyst	Peer Review
/S/ Thomas Bosch	/S/ Stephen Brose
03/28/2019 14:23	03/29/2019 12:58

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◓ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

ELMS Batch/HBN ID: 2230 (235529)
Prep Date: 03/27/2019 Analysis Date: 03/28/2019 Analyst: T. Bosch
Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\28MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 03/19/2019, sequence 19MAR19D.s Offline Quantitation Method: CLO4-DP2.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 6 Injection Volume: 25µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 645534; Target = 4.0µg/L. ASTM type II water was used for LMB 645533.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on sample 1907869001 (Client ID's: LH18/24-SP650_031419_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:
1) Results reported in µg/L. Field sample 1907867001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\MAR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\235529-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 645531) is reported from the analysis of the Laboratory Control Sample (LCS – 645534) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 19MARI03).

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2230 HBN: 235529 Sample Set IDs if Applicable: 1907867/1907869/1907871/1907894	Analyst Initials	Reviewer Initials
Calibration standards analyzed and meets criteria	TB	SB
Standards traceability checked and meets criteria	TB	SB
Standard curve coefficients evaluated and meet criteria	TB	SB
ICVs analyzed and meet acceptance criteria	TB	SB
CCVs analyzed and meet acceptance criteria	TB	SB
Method Blanks analyzed and meet acceptance criteria	TB	SB
Retention Time Windows checked	TB	SB
For method 8081A, Endrin/DDT Breakdown is checked for compliance	—	—
Surrogate recoveries checked and appropriately addressed	—	—
Method Preparation Blanks analyzed and meet acceptance criteria	TB	SB
MSs, MSDs, and/or MDs analyzed and calculations checked; applicable flags applied on QC reports; LCSs analyzed and meet acceptance criteria when performed	TB	SB
RLVS analyzed	TB	SB
Preparation and analysis hold times met	TB	SB
Preparation deviations and re-preparations noted when performed	TB	SB
Analysis deviations and re-analyses noted when performed	TB	SB
Sample dilution factors noted on reports	TB	SB
Electronic records in HBN transcription accuracy and completeness checked	TB	SB
Preparation and analysis calculations checked	TB	SB
NCRs are completed as necessary NC/CAR#	—	—
Report forms are complete and accurate	TB	SB
Manual integrations checked	TB	SB

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: JCC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Maintenance of Certification:
The real-time, long term stability of the RM may be monitored over the lifetime of the certification. If substantive changes occur that affect the certification before the expiration of this certificate, ULTRA Scientific will notify the purchaser.

CERTIFICATE OF ANALYSIS

S 43659

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

Signal Word: None

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)
Included on ISO/IEC 17025 Scope of Accreditation: Yes
Included on ISO 17034 Scope of Accreditation: Yes

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.
The final solution was checked against an independent standard to verify its concentration.
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.
All solutions are filtered through a 0.2 µm filter prior to being bottled.
All glassware used in preparation is Class A and calibrated regularly.
All weights are traceable through NIST, Test No. 822-275872-11
All bottles are triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.
We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

23118

Product Name: (Isotopic Label & Enrichment Specification)	PERCHLORIC ACID, SODIUM SALT (18O4, 90%+) 100 UG/ML IN WATER
Lot Number:	SDDG-013
Catalog Number:	OLM-7310-S

Product Information

Chemical Purity Specification:	≥98%
Labeled CAS Number:	NA
Unlabeled CAS Number:	7601-89-0
MW*:	130.4
Chemical Formula:	NaCl*O4
Storage:	Store at room temperature away from light and moisture.
Stability:	See storage and expiration date.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

Calibration Table

Perchlorate

Calib. Data Modified : 3/19/2019 2:35:19 PM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 20.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 20.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

Analytical Report for Service Re uest No: K1902558

RJ Modashia
ALS Laboratory Group
10450 Stancliff Road
Suite 210
Houston, TX 77099-4338

RE: ALS Houston DOD TOC

Dear RJ,

Enclosed are the results of the sample(s) submitted to our laboratory March 26, 2019
For your reference, these analyses have been assigned our service request number **K1902558.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3350. You may also contact me via email at Kelley.Lovejoy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Kelley Lovejoy

Table of Contents

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Service Request: K1902558
Date Received: 03/26/2019

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Group. This report contains analytical results and quality control parameters for samples designated for Tier IV validation deliverables, which includes summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt:

One water sample was received for analysis at ALS laboratory on 03/26/2019. The sample was received in good condition and consistent with the accompanying chain of custody form. Unless otherwise noted, samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry:

No significant anomalies were noted with this analysis.

Approved by Kelley Lovejoy Date 04/01/2019

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	(yes)/no/NA
2.	Holding times met for all analyses and for all samples?	(yes)/no/NA
3.	Are calculations correct?	(yes)/no/NA
4.	Is the reporting basis correct? (Dry Weight)	yes/no/(NA)
5.	All quality control criteria met?	(yes)/no
6.	Is the calibration curve correlation coefficient ≥ 0.995?	(yes)/no/NA
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	(yes)/no/NA
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	(yes)/no/NA
9.	Are results for methods blanks all ND?	(yes)/no/NA
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/(no)/NA
11.	Are all exceptions explained?	(yes)/no/NA
12.	Have all applicable service requests been reviewed?	(yes)/no/NA
13.	Are all samples labeled correctly?	(yes)/no/NA
14.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample, Form V)	(yes)/no/NA
15.	Are detection limits and units reported correctly?	(yes)/no/NA
16.	Is the unused space on the benchsheet crossed out?	(yes)/no/NA
17.	Was analysis turned in by the due date? (n-2) (If not record SR#)	(yes)/no/NA

COMMENTS: K1902607-1/1B report a high %RSD. However, these samples are less than 5x the MRL.

Final Approved by: [signature] Date: 03/29/19

Position	Sample Type	Sample ID	Method ID (Calibration ID)	Reps	Use	State
D	Check Standard	[TOC] CCB [0 ppm]	CAS_salt_010711 (CAS_salt_010711)	1	True	Ready
39	Sample	MB3	CAS_salt_010711 (CAS_salt_010711)	1	True	Ready
C	Check Standard	[TOC] LCS [24.0 ppm]	CAS_salt_010711 (CAS_salt_010711)	1	True	Ready
40	Sample	K1902607-002.03 doc 2x	CAS_salt_010711 (CAS_salt_010711)	2	True	Ready
41	Sample	K1902623-001.07 doc 100x	CAS_salt_010711 (CAS_salt_010711)	2	True	Ready
42	Sample	RB	CAS_salt_010711 (CAS_salt_010711)	2	True	Ready
43	Sample	K1902623-002.07 doc	CAS_salt_010711 (CAS_salt_010711)	2	True	Ready
44	Sample	RB	CAS_salt_010711 (CAS_salt_010711)	2	True	Ready
B	Check Standard	[TOC] CCV 25 ppm [25 ppm]	CAS_salt_010711 (CAS_salt_010711)	1	True	Ready
D	Check Standard	[TOC] CCB [0 ppm]	CAS_salt_010711 (CAS_salt_010711)	1	True	Ready
					False	

Fusion Report - 03282019
Thursday, March 28, 2019 12:22 PM

(View - Reps, Unused Reps, Meta-Data, Signature, History)
Printed on 2019/03/29 13:37 - Friday

Report Summary Information

Company Location: Gen Chem Lab
Schedule Name: 03282019
Instrument Name: Fusion1
Report Version: 1 of 1
Report Creation by Operators (schedule version): Fusion1 (Fusion1) (v2) Fusion1 (Fusion1) (v3) Fusion1 (Fusion1) (v4) Fusion1 (Fusion1) (v5) Fusion1 (Fusion1) (v6)
Comment:

Engine Version: 1.1.5.1
Firmware Version: 1.2.0696
Connection: RS232 COM1

Report Results

03/29/19

Sample Type: Clean — From Schedule Version 2

	Pos	Analysis Type	Sample ID	Start Time
◈	(clean)		Clean	2019/03/28 12:22

Rep #	Base Analysis Type	Adjusted (Abs)	NDIR (Abs)	Baseline (Abs)	Pressure (psig)	Run Time
1	IC Clean	12.77	15.74	2.97	49.67	05:24
2	TC Clean	5.47	8.34	2.86	49.86	07:16
3	TC Clean	2.02	5.15	3.13	50.03	03:57
4	TC Clean	1.43	4.57	3.14	50.04	03:56

Sample Type: Clean — From Schedule Version 3

	Pos	Analysis Type	Sample ID	Start Time
◈	(clean)		Clean	2019/03/28 12:48

Rep #	Base Analysis Type	Adjusted (Abs)	NDIR (Abs)	Baseline (Abs)	Pressure (psig)	Run Time
1	IC Clean	10.76	13.67	2.90	49.66	05:24
2	TC Clean	3.58	6.55	2.98	50.02	04:05

Work Order: **HS19031189**

Laboratory Results for: **Longhorn GW Treatment Plant**

Dear Marcia,

ALS Environmental received 2 sample(s) on Mar 22, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: DAYNA.FISHER

CASE NARRATIVE

GCMS Volatiles by Method SW8260

Batch ID: R335378

Sample ID: CCV_END

• Benzene and Toluene exceeded %D recoveries for closing CCV due to carryover from previous sample .

Sample ID: HS19031013-07MS

• MS and MSD are for an unrelated sample

Sample ID: VLCSW-190326

• 1,2,4_Trimethyl benzene exceeded QC limits for LCS. CCV is OK.

WetChemistry by Method SW9056

Batch ID: R335875

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

Laboratory Results for: **LH18/24 Longhorn GW Treatment Plant Weekly Samples**

Dear Marcia,

ALS Environmental received 2 sample(s) on Mar 28, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Analytical Report for Service Re uest No: K1902766

RJ Modashia
ALS Laboratory Group
10450 Stancliff Road
Suite 210
Houston, TX 77099-4338

RE: HS19031492

Dear RJ,

Enclosed are the results of the sample(s) submitted to our laboratory March 30, 2019
For your reference, these analyses have been assigned our service request number **K1902766.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3350. You may also contact me via email at Kelley.Lovejoy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Kelley Lovejoy

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Sample Matrix: Water

Service Request: K1902766
Date Received: 03/30/2019

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

One water sample was received for analysis at ALS Environmental on 03/30/2019. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The sample was stored at minimum in accordance with the analytical method requirements.

General Chemistry:

No significant anomalies were noted with this analysis.

Analysis: TOC/DOC

TOC: 630888, 630890

Run # DOC: 630891

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	yes/no/NA
2.	Holding times met for all analyses and for all samples?	yes/no/NA
3.	Are calculations correct?	yes/no/NA
4.	Is the reporting basis correct? (Dry Weight)	yes/no/NA
5.	All quality control criteria met?	yes/no
6.	Is the calibration curve correlation coefficient ≥ 0.995?	yes/no/NA
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/NA
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/NA
9.	Are results for methods blanks all ND?	yes/no/NA
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/NA
11.	Are all exceptions explained?	yes/no/NA
12.	Have all applicable service requests been reviewed?	yes/no/NA
13.	Are all samples labeled correctly?	yes/no/NA
14.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample, Form V)	yes/no/NA
15.	Are detection limits and units reported correctly?	yes/no/NA
16.	Is the unused space on the benchsheet crossed out?	yes/no/NA
17.	Was analysis turned in by the due date? (n-2) (If not record SR#)	yes/no/NA

COMMENTS: KP1902660-3/3d report a high %RSD. However, these samples are less than the MRL.

Final Approved by: _____ Date: 04/05/19

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1909152; 1909153; 1909154; 1909947; 1909949

Client: ALS Laboratories (Houston, TX)
Matrix: Water
ELMS Batch (HBN): 2233 (236356)

General Set Information: There were ten field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard (ISTD) of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 10.0mL aliquot of each sample was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Phenex PES membrane 0.45µm Syringe filters.

Holding Times: Holding times were met for all analyses.

Dilutions: Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

Method QC data: The method blank (LMB 647198) was less than 1/2 the CRDL. The recovery for the LCS (647199) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected. The MS/MSD relative percent difference (RPD) was within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level of 4.0µg/L. Due to limitations of the Chemstation Software, some of the chromatographic peaks may require manual integrations. A manual integration was performed for one of the Initial Calibration analyses (datafile: 19MARI03).

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Prep Date: 04/09/2019 Analysis Date: 04/10/2019 Analyst: T. Bosch
Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\28MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 03/19/2019, sequence 19MAR19D.s Offline Quantitation Method: CLO4-DP2.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 6 Injection Volume: 30µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 647199; Target = 4.0µg/L. ASTM type II water was used for LMB 647198.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:

1) Results reported in µg/L. Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters, except for the following. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\APR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\236356-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 19MARI03).

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2233 HBN: 236356 Sample Set IDs if Applicable: 1909152/1909153/1909154 1909147 / 1909149	Analyst Initials	Reviewer Initials

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

GHS

Signal Word: None

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)
Included on ISO/IEC 17025 Scope of Accreditation: Yes
Included on ISO 17034 Scope of Accreditation: Yes

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.
The final solution was checked against an independent standard to verify its concentration.
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.
All solutions are filtered through a 0.2 µm filter prior to being bottled.
All glassware used in preparation is Class A and calibrated regularly.
All weights are traceable through NIST, Test No. 822-275872-11
All bottles are triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.
We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

Product Name: (Isotopic Label & Enrichment Specification)	PERCHLORIC ACID, SODIUM SALT (18O4, 90%+) 100 UG/ML IN WATER
Lot Number:	SDDG-013
Catalog Number:	OLM-7310-S

Product Information

Chemical Purity Specification:	≥98%
Labeled CAS Number:	NA
Unlabeled CAS Number:	7601-89-0
MW*:	130.4
Chemical Formula:	NaCl*O4
Storage:	Store at room temperature away from light and moisture.
Stability:	See storage and expiration date.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

Calibration Table

Perchlorate

Calib. Data Modified : 3/19/2019 2:35:19 PM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 20.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 20.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

Work Order: **HS19031508**

Laboratory Results for: **LH18/24 Longhorn GW Treatment Plant Weekly Samples**

Dear Marcia,

ALS Environmental received 2 sample(s) on Mar 28, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

ALS Houston, US Date: 12-Apr-19

Client: Bhate Environmental Associates, Inc. **CASE NARRATIVE**
Project: LH18/24 Longhorn GW Treatment Plant Weekly Samples
Work Order:

Work Order Comments

• The analysis for Perchlorate was subcontracted to ALS Salt Lake City, UT. Final report attached.

GCMS Semivolatiles by Method SW8270SIM

Batch ID: 139415

Sample ID: LH18/24-SP140_032719 (HS19031508-01)

• The surrogate recoveries could not be determined due to dilution below the calibration range.

GCMS Volatiles by Method SW8260

Batch ID: R335882

Sample ID: CCV

• 1,2-Dibromoethane, Bromoform and Dibromochloromethane exceeded %D limits for CCV. Samples are ND for these compounds.

Sample ID: HS19040036-36MS

• MS and MSD are for an unrelated sample

Metals by Method SW6020

Batch ID: 139323

Sample ID: HS19031584-01MS

• MS/MSD and DUPs are for an unrelated sample

Metals by Method SW7470

Batch ID: 139318

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method E1664A

Batch ID: R336080

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method SW9056

Batch ID: R335875

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method E410.4

Batch ID: R335804

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
mg/L	Milligrams per Liter

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1909152; 1909153; 1909154; 1909947; 1909949

Client: ALS Laboratories (Houston, TX)
Matrix: Water
ELMS Batch (HBN): 2233 (236356)

General Set Information: There were ten field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard (ISTD) of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 10.0mL aliquot of each sample was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Phenex PES membrane 0.45µm Syringe filters.

Holding Times: Holding times were met for all analyses.

Dilutions: Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

Method QC data: The method blank (LMB 647198) was less than 1/2 the CRDL. The recovery for the LCS (647199) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected. The MS/MSD relative percent difference (RPD) was within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level of 4.0µg/L. Due to limitations of the Chemstation Software, some of the chromatographic peaks may require manual integrations. A manual integration was performed for one of the Initial Calibration analyses (datafile: 19MARI03).

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◆ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\28MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 03/19/2019, sequence 19MAR19D.s Offline Quantitation Method: CLO4-DP2.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 6 Injection Volume: 30µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 647199; Target = 4.0µg/L. ASTM type II water was used for LMB 647198.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:

1) Results reported in µg/L. Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters, except for the following. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\APR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\236356-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 19MARI03).

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2233 HBN: 236356 Sample Set IDs if Applicable: 1909152/1909153/1909154 1909147 / 1909149	Analyst Initials	Reviewer Initials
Calibration standards analyzed and meets criteria	TB	SB
Standards traceability checked and meets criteria	TB	SB
Standard curve coefficients evaluated and meet criteria	TB	SB
ICVs analyzed and meet acceptance criteria	TB	SB
CCVs analyzed and meet acceptance criteria	TB	SB
Method Blanks analyzed and meet acceptance criteria	TB	SB

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Maintenance of Certification:
The real-time, long term stability of the RM may be monitored over the lifetime of the certification. If substantive changes occur that affect the certification before the expiration of this certificate, ULTRA Scientific will notify the purchaser.

S 43659

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)
Included on ISO/IEC 17025 Scope of Accreditation: Yes
Included on ISO 17034 Scope of Accreditation: Yes

GHS

Signal Word: None

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.
The final solution was checked against an independent standard to verify its concentration.
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.
All solutions are filtered through a 0.2 µm filter prior to being bottled.
All glassware used in preparation is Class A and calibrated regularly.
All weights are traceable through NIST, Test No. 822-275872-11
All bottles are triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.
We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

23118

Product Name: (Isotopic Label & Enrichment Specification)	PERCHLORIC ACID, SODIUM SALT (18O4, 90%+) 100 UG/ML IN WATER
Lot Number:	SDDG-013
Catalog Number:	OLM-7310-S

Product Information

Chemical Purity Specification:	≥98%
Labeled CAS Number:	NA
Unlabeled CAS Number:	7601-89-0
MW*:	130.4
Chemical Formula:	NaCl*O4
Storage:	Store at room temperature away from light and moisture.
Stability:	See storage and expiration date.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

Calibration Table

Perchlorate

Calib. Data Modified : 3/19/2019 2:35:19 PM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 20.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 20.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

Work Order: **HS19031511**

Laboratory Results for: **LH18/24 Longhorn GW Treatment Plant Weekly Samples**

Dear Marcia,

ALS Environmental received 3 sample(s) on Mar 28, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Client: Bhate Environmental Associates, Inc. **CASE NARRATIVE**
Project: LH18/24 Longhorn GW Treatment Plant Weekly Samples
Work Order:

Work Order Comments

• The analysis for Perchlorate was subcontracted to ALS Salt Lake City, UT. Final report attached.

GCMS Semivolatiles by Method SW8270SIM

Batch ID: 139415

Sample ID: LH18/24-SP650_032719 (HS19031511-01)

• The surrogate recoveries could not be determined due to dilution below the calibration range.

GCMS Volatiles by Method SW8260

Batch ID: R335882

Sample ID: CCV

• 1,2-Dibromoethane, Bromoform and Dibromochloromethane exceeded %D limits for CCV. Samples are ND for these compounds.

Sample ID: HS19040036-36MS

• MS and MSD are for an unrelated sample

Metals by Method SW6020

Batch ID: 139323

Sample ID: HS19031584-01MS

• MS/MSD and DUPs are for an unrelated sample

Metals by Method SW7470

Batch ID: 139318

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method E1664A

Batch ID: R336080

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method SW9056

Batch ID: R335875

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method E410.4

Batch ID: R335804

• The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1909152; 1909153; 1909154; 1909947; 1909949

Client: ALS Laboratories (Houston, TX)
Matrix: Water
ELMS Batch (HBN): 2233 (236356)

General Set Information: There were ten field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard (ISTD) of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 10.0mL aliquot of each sample was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Phenex PES membrane 0.45µm Syringe filters.

Holding Times: Holding times were met for all analyses.

Dilutions: Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

Method QC data: The method blank (LMB 647198) was less than 1/2 the CRDL. The recovery for the LCS (647199) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected. The MS/MSD relative percent difference (RPD) was within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level of 4.0µg/L. Due to limitations of the Chemstation Software, some of the chromatographic peaks may require manual integrations. A manual integration was performed for one of the Initial Calibration analyses (datafile: 19MARI03).

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Comments

Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.

QC Report Authorization (/S/ is an electronic signature that complies with 21 CFR Part 11)

Analyst	Peer Review
/S/ Thomas Bosch	/S/ Stephen Brose
04/11/2019 13:48	04/11/2019 15:00

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◓ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Prep Date: 04/09/2019 Analysis Date: 04/10/2019 Analyst: T. Bosch
Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\28MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 03/19/2019, sequence 19MAR19D.s Offline Quantitation Method: CLO4-DP2.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 6 Injection Volume: 30µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 647199; Target = 4.0µg/L. ASTM type II water was used for LMB 647198.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on sample 1909152001 (Client ID's: LH18/24-SP650_032719_BIX). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:

1) Results reported in µg/L. Field sample 1909153001 was analyzed and reported from a 1:1,000 dilution. The reporting limit has been adjusted accordingly.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters, except for the following. The MS/MSD – 647200/01 failed QC acceptance criteria for percent recoveries, biased high. This is due to the fact that the unspiked sample result of 2.574µg/L was not subtracted from the MS/MSD results. The Matrix Spike and Matrix Spike duplicate is reported for the clients' information only. The sample matrix may be inappropriate for the method selected.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\APR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\236356-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 647196) is reported from the analysis of the Laboratory Control Sample (LCS – 647199) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 19MARI03).

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2233 HBN: 236356 Sample Set IDs if Applicable: 1909152/1909153/1909154 1909147 / 1909149	Analyst Initials	Reviewer Initials

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

CERTIFICATE OF ANALYSIS

S 43659

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

GHS

Signal Word: None

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)
Included on ISO/IEC 17025 Scope of Accreditation: Yes
Included on ISO 17034 Scope of Accreditation: Yes

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.
The final solution was checked against an independent standard to verify its concentration.
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.
All solutions are filtered through a 0.2 µm filter prior to being bottled.
All glassware used in preparation is Class A and calibrated regularly.
All weights are traceable through NIST, Test No. 822-275872-11
All bottles are triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.
We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

23118

Product Name: (Isotopic Label & Enrichment Specification)	PERCHLORIC ACID, SODIUM SALT (18O4, 90%+) 100 UG/ML IN WATER
Lot Number:	SDDG-013
Catalog Number:	OLM-7310-S

Product Information

Chemical Purity Specification:	≥98%
Labeled CAS Number:	NA
Unlabeled CAS Number:	7601-89-0
MW*:	130.4
Chemical Formula:	NaCl*O4
Storage:	Store at room temperature away from light and moisture.
Stability:	See storage and expiration date.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

Calibration Table

Perchlorate

Calib. Data Modified : 3/19/2019 2:35:19 PM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 20.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 20.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

APPENDIX D
LABORATORY ANALYTICAL RESULTS FOR LHAAP-16 (PROVIDED ON CD ONLY)

This page intentionally left blank.

10450 Stancliff Rd. Suite 210
Houston, TX 77099
T: +1 281 530 5656
F: +1 281 530 5887

March 08, 2019

Marcia Olive
Bhate Environmental Associates, Inc.
445 Union Blvd Ste 129
Lakewood, CO 80228

Work Order: **HS19021428**

Laboratory Results for: **LHAAP Site 16**

Dear Marcia,

ALS Environmental received 9 sample(s) on Feb 27, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: DAYNA.FISHER

CASE NARRATIVE

Work Order Comments

- The analysis for Perchlorate was subcontracted to ALS in Salt Lake City, Utah. Final report attached.

GCMS Volatiles by Method SW8260

Batch ID: R334128

Sample ID: 16EW01_022619 (HS19021428-01MS/MSD)

- MS and/or MSD recovered outside control limits for multiple compounds

Batch ID: R334221

Sample ID: 16EW08_022619 (HS19021428-09MSD)

- MSD recovered outside control limits for multiple compounds

Sample Delivery Details / Laboratory Receipt

Delivered Directly to Lab: ______ Shipped
No.:
Method of Shipment: ______
Fed Ex ______ Airbill Number:
Analytical Lab: ALS 10450 Stancliff Rd. Suite 210 Houston TX 77099 (281) 530-5656
ATTN: SONIA WEST Lab Recipient: Delivery Date/Time:

1.) Chain of Custody Number = date collected + custody number (e.g. 09-02-1999-01)
2.) Sample Type (SA) Codes: N = Normal Sample, TB = Trip Blank (-t) Sample, FD = Field Duplicate (-a) Samples, FR = Field Replicate (-b) Samples, EB = Equipment Blank (-d) Samples, MS = Matrix Spike, SD = Matrix Spike Duplicate, AB = Ambient Blank (-e)
3.) Sample Number: Unique sample number collected from a particular location per day. (e.g. Groundwater sample collected from MW-1 on 10/10/99 = 01, if sampled again on 10/10/99 = 02, etc.)
4.) Matrix Codes: GS = Soil Gas, WG = Groundwater, WS = Surface Water, SO = Soil, SE = Sediment, SL = Sludge, SS = Surface Soil Samples, WQ = Aqueous Blank Samples (trip, equipment, ambient, etc), SQ = Soil Blanks
5.) Sample Analysis Requested: Analytical method requested and number of containers provided for each.
6.) Quality assurance samples are assigned by date (ddmmyy) and the sample number associated with the sample (01, 02, etc) (e.g. Equipment blank collected in association with MW-1 on 10/10/99 will be designated 1010901 in the Equipment Blank Lot Control

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1905651; 1906112; 1906330; 1906332; 1906334

Client: ALS Laboratories (Houston, TX)
Matrix: Water
ELMS Batch (HBN): 2223 (233911)

General Set Information: There were thirteen field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard (ISTD) of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 10.0mL aliquot of each sample was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Phenex PES membrane 0.45µm Syringe filters.

Holding Times: Holding times were met for all analyses.

Dilutions: Field samples 1906112004/05 were re-analyzed and reported from 1:10 dilutions. Field sample 1906330001 was analyzed and reported from a 1:100 dilution. The reporting limits have been adjusted accordingly.

Method QC data: The method blank (LMB 642099) was less than 1/2 the CRDL. The recovery for the LCS (642100) was within acceptable parameters.

MS/MSD Analysis: MS/MSD was performed on samples 1906112002/03 (Client ID's: EW01_022619). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. The spike target was 4.µg/L. The MS/MSD percent recoveries and relative percent difference (RPD) were within the performance limits, except for the following. The Matrix Spike and duplicate (MS/MSD) failed QC acceptance criteria for percent recoveries. The MS/MSD is reported for the clients' information only. The sample matrix may be inappropriate for the method selected.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): NA

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 5.1.1. The Reporting Limit Verification Standard (RLVS – 642097) is reported from the analysis of the Laboratory Control Sample (LCS – 642100) at a level of 4.0µg/L. Sample 1906112007 failed the 50-150% method requirement for ISTD recovery. This sample was re-prepped, re-analyzed and reported. Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 15FEBI04) along with datafiles 05MARD07-10.

Comments

Quality Control: EPA 6850, DoD QSM - (HBN: 233911)

Field samples 1906112004/05 were re-analyzed and reported from 1:10 dilutions. Field sample 1906330001 was analyzed and reported from a 1:100 dilution. The reporting limits have been adjusted accordingly.

Report Authorization (/S/ is an electronic signature that complies with 21 CFR Part 11)

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< Means this testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

* - Analyte above reporting limit or outside of control limits
▲ - Sample result is greater than 4 times the spike added
◆ - Sample and Matrix Duplicate less than 5 times the reporting limit
● - Result is above the calibration range
- The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Analyte: **Perchlorate** Matrix: **Water** Method: **6850**
Sequence: \\HPCHEM\1\SEQUENCE\CLO4\2019\MAR\05MAR19D.s
Reported DL: **1.0µg/L** Reported LOD: **2.0µg/L** Reported LOQ: **4.0µg/L**

SAMPLE PREPARATION/ANALYSIS:

Water: Samples were prepared by TNB. 10.0mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent A1: 95% ASTM Type II water (ALS)/ 5% ACN (B&J Lot AH015-4)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent B1: 95% ACN (B&J Lot AH015-4)/ 5% ASTM Type II water (ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 43730. Dilutions of Working Standard Solution ID 43702 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 02/15/2019, sequence 15FEB19D.s Offline Quantitation Method: CLO4-DP1.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89.
Instrument ID: LCMS04 Online Acquisition Method: CLO4-AQN.M Fragmentor: 160 Output Gain: 3 Injection Volume: 30µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 70% Eluent A1; 30% Eluent B1

FLOW GRADIENT:

Time (min.)	Flow (mL/min)
0	0.65
5.8	0.65
5.9	0.25
10.3	0.25
10.5	0.65
12.0	0.65

QC DATA: 4.0µL of QC Solution Horizon ID 41830 was used for LCS 642100; Target = 4.0µg/L. ASTM type II water was used for LMB 642099.

MS/MSD: The Matrix Spike and duplicate (MS/MSD) were performed on samples 1906112002/03 (Client ID's: EW01_022619). 4.0µl of Working Standard Solution Horizon ID 43701 was added to 10.0mL of sample preparation. Spike target = 4.0µg/L.

COMMENTS:

1) Results reported in µg/L. Field samples 1906112004/05 were re-analyzed and reported from 1:10 dilutions. Field sample 1906330001 was analyzed and reported from a 1:100 dilution. The reporting limits have been adjusted accordingly. Sample 1906112007 failed the 50-150% method requirement for ISTD recovery. This sample was re-prepped, re-analyzed and reported.
2) All QC, Blank, CCV, and MS/MSD results were within method parameters, except for the following. The Matrix Spike and duplicate (MS/MSD) failed QC acceptance criteria for percent recoveries. The MS/MSD is reported for the clients' information only. The sample matrix may be inappropriate for the method selected.
3) Sample data can be viewed at two directories within the ALS system: \\ALSLTWS013\LCMS\LCMS04\2019\MAR\HBN# or through NuGenesis\Tree\PrintData\LCMS\DefaultView.
4) Notebook: \\alsltws013\ORGANIC\BOSCH\LCMS\Perchlorates\Waters\2019\23911-DoD-ALS-Hstn LCMS4 or through \\ALSLTWS013\DATAREVIEW\HBN#
5) The Reporting Limit Verification Standard (RLVS – 642097) is reported from the analysis of the Laboratory Control Sample (LCS – 642100) at a level 4.0µg/L.
6) Due to limitations of the Chemstation Software, many of the chromatographic peaks require manual integration. Manual Integrations were performed for one of the Initial Calibration analyses (datafile: 15FEBI04) along with datafiles 05MARD07-10.

5.5 Chromatography (GC, HPLC and LC/MS) Technical Review

Note: It is the peer reviewer's responsibility to ensure that appropriate criteria are used as defined in the HORIZON PROFILE. The evaluation criteria are prioritized as per Section 2.2 of this SOP. These items must be checked for all projects. The following checklist will be completed by both the analyst and the peer reviewer and scanned into the HBN folder with the raw data.

Chromatography (GC, HPLC, LC/MS) Technical Review Criteria Batch(es)/SDG: ELMS: 2223 HBN: 233911 Sample Set IDs if Applicable: 1905651/1906912/1906330 1906332/1906334	Analyst Initials	Reviewer Initials

ULTRA SCIENTIFIC
Analytical Solutions

Certificate of Analysis

ISO Guide 34 Reference Material

Product Number: ICC-013
Lot Number: CP-0860

Lot Issue Date: 29-Feb 2016
Expiration Date: 31-Mar 2020

Product Name: Perchlorate IC Standard

Description:
This Reference Material (RM) was gravimetrically prepared in accordance with ISO Guide 34 and under ULTRA Scientific's ISO 9001 registered quality system. The neat materials used for this product have been verified by ULTRA's ISO 17025 laboratory and under ULTRA's ISO Guide 34 accreditation. The analyte concentrations were verified by ULTRA's ISO 17025 accredited laboratory. For each analyte, the true value, with its uncertainty value calculated at the 95% confidence level, is reported below.

Analyte	Starting Material	Lot Number	Purity (%)	Calculated Value	True Value	Traceability & Method
perchlorate	potassium perchlorate	RM07987	100	1001 ± 5 µg/mL	976 ± 6 µg/mL	NIST SRM 3141A; ICP-OES

Solvent: water (low TOC, < 50 ppb)

Storage: Store at Room Temperature (15° to 30°C).

Traceability:
Traceability has been established through an unbroken chain of comparisons, each having stated uncertainties. Comparisons are based on appropriate physical or chemical measurements, including gravimetric or volumetric dilution, where the mass or volume of a solution before and after dilution is measured. The balances used for these measurements are calibrated with weights traceable to NIST in compliance with ANSI/NCSL Z-540-1, ISO 9001, ISO 17025, and ISO Guide 34. Calibrated Class A glassware is used for volumetric measurements. Thermometers are calibrated against a NIST traceable thermometer in accordance with NIST Special Publication 819.

Estimation of Uncertainties:
The true value is reported, with its uncertainty value calculated at the 95% confidence level.

Homogeneity:
This RM was formulated and unitized according to an in-house procedure and is guaranteed to be homogeneous. There is no minimum sub-sample size required.

Intended Use:
This RM is intended for the preparation of working reference samples for use in routine laboratory analyses, calibration of instruments, validation of analytical methods, assessments of measurement methods and continuing calibration verification.

Instructions for Use:
Sample aliquots for analysis should be withdrawn at 20°C to 25°C immediately after opening and should be processed without delay for the true value to be valid within the stated uncertainties. Do not pipet from the bottle. Do not return any material removed for pipetting to the bottle. Tightly cap the bottle after removing any material and store according to the instructions noted above.

Hazards:
Refer to the Safety Data Sheet for information regarding this RM.

Expiration of Certification:
The certification of this RM is valid, within the measurement uncertainty specified, until the expiration date specified above, provided the RM is handled and stored in accordance with the instructions given in this certificate. This certification is nullified if the RM is damaged, contaminated, or otherwise modified.

AccuTrace™ Reference Standard

Catalog No: IC-PER-10X-1
Description: Perchlorate Standard
Element: Perchlorate (ClO_4)
SRM: Ind. Std.
Lot: 218065075
Matrix: Water
Hazards: *Refer to SDS for complete safety information*

GHS

Signal Word: None

Date Certified: Jun 25, 2018
Expiration: Jul 25, 2020
Sample Size: 100 mL
Components: 1
Storage Condition: Ambient (>5 °C)

Included on ISO/IEC 17025 Scope of Accreditation: Yes

Included on ISO 17034 Scope of Accreditation: Yes

Component		SRM #	Prepared Concentration (µg/mL)
ClO_4	Perchlorate	Ind. Std.	1000

The gravimetric uncertainty for this product is ±0.24%.

The final solution was checked against an independent standard to verify its concentration.

We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as ASTM Type I 18 megohm deionized water.

All solutions are filtered through a 0.2 µm filter prior to being bottled.

All glassware used in preparation is Class A and calibrated regularly.

All weights are traceable through NIST, Test No. 822-275872-11

All bottles are triple rinsed with deionized water prior to use.

Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.

We certify the accuracy of this standard to be ±0.5% of the stated value until its expiration date provided it is kept tightly capped and stored under the conditions stated above.

Certification

Cambridge Isotope Laboratories, Inc. guarantees that this material meets or exceeds the specifications stated. Absolute identity as well as chemical and isotopic purities are assured by the use of unambiguous synthetic routes and multiple chemical analyses whenever possible. Results are representative of QC testing at time of release from Quality Control unless otherwise stated.

Volumetric measurements were made with Class A glassware. Gravimetry is traceable to the NIST through calibrated balances and certified, calibrated, standard weights. The calibrations are traceable to the NIST under Test No. 822/270236-04. The calibrations also meet specifications outlined in ISO 9001, ISO/IEC 17025, ANSI/NSCL Z540-1-1994, NCR Document 10CFR50 Appendix B, and applicable subdocuments.

This COA references the bulk catalog number before packaging. The COA also applies to the CIL finished good catalog number. Some possible packaging sizes and their corresponding suffix are -1.2, -1, -0.5, -10, or -0.1.

* *For isotopically labeled compounds, MW listed is for the fully enriched product.*

QUARTERLY CONTROL SUMMARY REPORT
1st QUARTER (JANUARY - MARCH) 2019
GROUNDWATER TREATMENT PLANT
LONGHORN ARMY AMMUNITION PLANT
KARNACK, TEXAS

May 2019

Prepared For:

Longhorn Army Ammunition Plant
Karnack, Texas

Under Contract To:

U.S. Army Corps of Engineers
Tulsa District
Tulsa, Oklahoma

Contract Number: W9128F-13-D-0012
Task Order Number: W912BV17F0150

Prepared By:

1608 13th Avenue South, Suite 300
Birmingham, Alabama 35205
1-800-806-4001 • www.bhate.com

Tables

1 INTRODUCTION

Bhate reviewed 17 data packages from ALS Environmental, Houston, Texas. Groundwater samples were collected from February 21, 2019, through March 27, 2019, at the Groundwater Treatment Plant (GWTP) and Site LHAAP-16 at Longhorn Army Ammunition Plant (LHAAP), Karnack, Texas. No samples were collected during the month of January due to mechanical issues at the GWTP. Data were reviewed for conformance to the requirements of the following guidance documents: *USEPA Contract Laboratory Program* [CLP] *National Functional Guidelines for Superfund Organic Methods Data Review* (USEPA, January 2017); *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review* (USEPA, January 2017); and the *Final Basewide Uniform Federal Policy* [UFP] – *Quality Assurance Project Plan* [QAPP] *Longhorn Army Ammunition Plant* which is in Appendix C of the *Final Installation-Wide Work Plan for Longhorn Army Ammunition Plant Karnack, Texas* (Bhate, May 2018).

1.1 Intended Use of Data

The objective of sampling at the GWTP is to monitor effluent streams to confirm compliance with discharge limits.

Analyses performed include:

- SW6850 – Perchlorate
- E350.3/SM4500 NH3 – Nitrogen, Ammonia
- E365.3/SM4500 P – Orthophosphate
- E415.1/SM5310 – Total Organic Carbon
- SW8260C – Volatile Organic Compounds (VOCs)
- SW8270D Selected Ion Monitoring (SIM) - 1,4-Dioxane
- SW6020A/7470A – Metals
- SW9056A – Chloride (Cl) and Sulfate (SO_4)
- SW7196A – Hexavalent Chromium
- E410.4 – Chemical Oxygen Demand
- E1664A – Oil and Grease
- TO-15 – Volatiles in Air

Table 1 lists the sample identification numbers (IDs) and their associated laboratory package.

Table 2 lists qualified results with the qualification flag and reason code.

The following narrative is a brief synopsis of data that required qualification due to quality control discrepancies.

1.2 Preservation and Holding Times

Sample identification data were evaluated for agreement with the chain-of-custody (COC). All samples were received in appropriate containers, within the proper temperature range, in good condition, and within the required hold time.

1.3 Calibrations

All analytes reported must be present in the initial and continuing calibration. The calibrations must meet the acceptance criteria specified in Worksheet 24 (Analytical Instrument Calibration) of the QAPP. All results reported must be within the calibration range. Samples were diluted, if necessary, to bring analyte responses within the calibration range.

1.3.1 Continuing Calibration Verifications (CCV)

The calibrations must meet the following criteria otherwise the compound is qualified J or UJ: The continuing calibration verification (CCV) criteria are 20 percent difference (%D) for VOCs and Semi-Volatile Organic Compounds (SVOCs) and 50% for closing CCVs. Metals and general chemistry - 10%D; perchlorate - 15%D; and volatiles in air - 30%D.

The CCV for benzene and toluene was exceeded for the bi-weekly sample LH18/24-SP650_032119. The CCV for 1,2-dibromoethane, bromoform, and dibromochloromethane were also outside control limits for quarterly influent sample LH18/24-SP140_032719. These compounds were qualified as estimated non-detects and flagged "UJ".

1.4 Blanks

If the analyte result for an associated sample was less than 5X (10X for common laboratory contaminants) the analyte concentration in the blank, that result was qualified "UB" and considered an artifact of blank contamination. Where the sample result for the affected analyte was non-detect or greater than 5X the amount in the blank, no qualifier was applied.

1.4.1 SW6020A

The method blank for quarterly effluent and influent samples LH18/24-SP650_032719 and LH18/24-SP140_032719, respectively reported a low level detection of vanadium. Since the sample results were < 5X the blank result, they were considered artifacts of blank contamination and flagged "UB".

1.5 Surrogates

Surrogates were evaluated using limits defined by each method in the project-specific QAPP Worksheet 28.

1.5.1 SW8270D SIM

The monthly effluent sample LH18/24-SP650_031419 reported 2-fluorobiphenyl (193%) above QC limits. 1,4-Dioxane was considered as estimated and flagged "J".

1.6 Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD)

LCS/LCSD recoveries were evaluated using limits defined in the project-specific QAPP Worksheet 15.

All sample recoveries were within control limits.

1.7 Matrix Spike (MS)/Matrix Spike Duplicate Sample (MSD)

MS/MSD recoveries were evaluated using limits defined in Worksheet 15 of the project-specific QAPP. When sample results were greater than 4X the spike amount, control limits were not applicable and require no qualification. Furthermore, if a MS/MSD analyses was performed on a batched (unrelated) sample, no qualification was made to the sample data.

1.7.1 SW6850

Site LHAAP-16 reported the MS and MSD recoveries of perchlorate below control limits. This compound was qualified as estimated, "J", in the sample used for the spike analysis (16EW01_022619).

1.7.2 SW8260C

Site LHAAP-16 reported the MSD recovery of cis-1,2-dichloroethene below control limits. This compound was qualified as estimated, "J", in the sample used for the spike analysis (16EW01_022619).

1.7.3 SW6850

The MS/MSD recoveries for GWTP sample LH18/24-SP650_032719_BIX were above control limits. The perchlorate result was considered estimated and flagged "J".

1.8 Internal Standards

If the percent recovery (%R) for an internal standard in a sample is not within the limit, the associated sample is qualified for those analytes associated with the internal standard(s) outside of the limit.

Internal standards were within acceptance criteria for the associated compounds.

1.9 Field Precision

Precision is the measure of variability of individual sample measurements. Evaluation of field duplicates for precision was done using the relative percent difference (RPD) calculation. The RPD is defined as the difference between two duplicate samples divided by the mean and expressed as a percent. Field duplicate RPD limits were set at <30% for groundwater and air matrices.

1.9.1 SW8260C

The LHAAP-16 RPD, between 16EW05_022619 and its duplicate, was exceeded for vinyl chloride. This compound was qualified as estimated, "J", in both sample and duplicate.

2 DATA USABILITY SUMMARY

The data are usable for the intended purposes of the project (see Table 3). The data quality objectives have been met for the project.

16EW05_022619_a	HS19021428	Vinyl chloride	420 J	Dup RPD

Notes:
ID – identification
J – Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
UJ – The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
UB – considered an artifact of blank contamination
MS/MSD </>– Matrix spike/duplicate recovery below/above control limits
Dup RPD – the relative percent difference between sample and duplicate was outside control limits
MB – Method blank contamination
CCV – continuing calibration verification outside control limits
HS - Houston

LABORATORY REPORT

March 25, 2019

Marcia Olive
Bhate Environmental Associates, Inc.
445 Union Blvd Suite 129
Lakewood, CO 80228

RE: LHAAP GWTP / NW01312.0150

Dear Marcia:

Enclosed are the results of the samples submitted to our laboratory on March 5, 2019. For your reference, these analyses have been assigned our service request number P1901179.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

By Michael Conejo at 9:24 am, Mar 25, 2019

Michael Conejo
Project Manager

2655 Park Center Dr., Suite A
Simi Valley, CA 93065
T: +1 805 526 7161
www.alsglobal.com

Client: Bhate Environmental Associates, Inc. Service Request No: P1901179
Project: LHAAP GWTP / NW01312.0150

CASE NARRATIVE

The samples were received intact under chain of custody on March 5, 2019 and were stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Volatile Organic Compound Analysis

The samples were analyzed for volatile organic compounds and in accordance with EPA Method TO-15 from the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (EPA/625/R-96/010b), January, 1999. This procedure is described in laboratory SOP VOA-TO15. The analytical system was comprised of a gas chromatograph / mass spectrometer (GC/MS) interfaced to a whole-air preconcentrator. This method is included on the laboratory's NELAP and DoD-ELAP scope of accreditation. Any analytes flagged with an X are not included on the NELAP or DoD-ELAP accreditation.

The containers were cleaned, prior to sampling, down to the method reporting limit (MRL) reported for this project. For projects requiring DoD QSM 5.1 compliance canisters were cleaned to <1/2 the MRL. Please note, projects which require reporting below the MRL could have results between the MRL and method detection limit (MDL) that are biased high.

ALS Environmental
Sample Acceptance Check Form

Client: Bhate Environmental Associates, Inc. Work order: P1901179

Project: LHAAP GWTP / NW01312.0150

Sample(s) received on: 3/5/19 Date opened: 3/5/19 by: ADAVID

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☒	☐
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☐	☐	☒
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Lab Sample ID	Container Description	Required pH *	Received pH	Adjusted pH	VOA Headspace (Presence/Absence)	Receipt / Preservation Comments
P1901179-001.01	6.0 L Silonite Can					
P1901179-002.01	6.0 L Silonite Can					
P1901179-003.01	6.0 L Silonite Can					
P1901179-004.01	6.0 L Silonite Can					

Explain any discrepancies: (include lab sample ID numbers):

RSK - MEEPP, HCL (pH<2); RSK - CO2, (pH 5-8); Sulfur (pH>4)

IS1 (BCM) = Bromochloromethane
IS2 (DFB) = 1,4-Difluorobenzene
IS3 (CBZ) = Chlorobenzene-d5

AREA UPPER LIMIT = 140% of internal standard area
AREA LOWER LIMIT = 60% of internal standard area
RT UPPER LIMIT = 0.33 minutes of internal standard RT
RT LOWER LIMIT = 0.33 minutes of internal standard RT

# Column used to flag values outside QC limits with an I.
I = Internal standard not within the specified limits.

APPENDIX G
PROTOCOL FOR DISCHARGING GWTP EFFLUENT

This page intentionally left blank.

MEMORANDUM

DATE: August 28, 2017

PROJECT NAME: Remediation of Multiple Sites, Longhorn Army Ammunition Plant, Karnack, TX

TO:	Richard Mayer	Senior Project Engineer US Environmental Protection Agency Federal Facilities Section (6PD-F)
	April Palmie	Project and Grant Manager Superfund Section, Remediation Division Texas Commission on Environmental Quality
FROM:	Rose M. Zeiler, Ph.D.	Longhorn AAP Site Manager

SUBJECT: **Protocol for Discharging GWTP Effluent**
Longhorn Army Ammunition Plant, Karnack, TX
(Contract: W912DY-09-D-0059, Task Order DS01)

INTRODUCTION

The purpose of this memo is to document the protocol for discharging Longhorn Army Ammunition Plant groundwater treatment plant (GWTP) effluent to Harrison Bayou, the INF-Pond, or LHAAP-18/24.

The GWTP is designed to:

- Extract groundwater from LHAAP-18/24 and LHAAP-16 for hydraulic control;
- Remove metals by pH adjustment, polymer addition, and gravity separation;
- Remove volatile organic compounds (VOCs) by air stripping;
- Remove perchlorate in a fluidized bed reactor (FBR) and an ion exchange scavenger system; and
- Discharge the effluent continuously.

DISCHARGE CRITERIA

The discharge criteria established for discharge to Harrison Bayou are:

Parameter	Discharge Criteria (µg/L)	
	Daily Average	Daily Maximum
Volatiles		
1,1,1-Trichloroethane	3,417	7,230
1,1,2-Trichloroethane	102.5	216.9
1,1-Dichloroethane	6,633	14,032
1,1-Dichloroethene	119	253

* - Based upon flow in Harrison Bayou

** - Discharge criteria, when diverted to the INF Pond, is 17 µg/L

PROTOCOL FOR DISCHARGING GWTP EFFLUENT

In accordance with the *Sampling and Analysis Plan, Groundwater Treatment Plant and Well Fields* (SAP) Table 2-2, indicator parameters for the FBR, such as temperature, pH and oxidation reduction potential (ORP), are monitored in real time to predict FBR performance and perchlorate removal. Based upon these indicator parameters, the operator of the GWTP can make adjustments such as:

- Bring the ion exchange system online;
- Increase or decrease the addition rate of electron donor (acetic acid);
- Increase or decrease the nutrient addition rate (urea or phosphoric acid); or
- Increase or decrease the FBR recirculation rate

Samples of the GWTP effluent are collected weekly, analyzed for perchlorate, nutrients (ammonia-nitrogen and ortho-phosphate), total organic carbon (TOC), chloride, and sulfate, with the results received from the laboratory 14 days later. Other parameters (e.g. Record of Decision metals and volatiles) are collected and analyzed in GWTP effluent samples according to the frequencies listed in Table 2-1 of the SAP.

As shown in Figure 1, groundwater is continuously extracted, treated, and discharged. If Harrison Bayou is flowing and indicator parameters are within their historical optimal ranges, then the ion exchange vessels can be bypassed and the GWTP effluent sample will be collected after the FBR. If Harrison Bayou is not flowing or the indicator parameters are not within historical optimal ranges, then the ion exchange vessels will be put on line, and the GWTP effluent sample will be collected between the lead and lag ion exchange vessel. Professional judgement may also be used as to when to bring the ion exchange vessels online, such as after a power outage or during anticipated cold temperatures when the FBR has historically not performed optimally.

If a parameter is measured in the effluent at a concentration above the discharge criteria, then a confirmation sample and an effluent sample after the lag ion exchange vessel will be collected and analyzed for the parameter with a 24-hour turnaround time. Corrective measures (e.g. increased nutrient or electron donor addition rates, bring ion exchange vessels on line) will be implemented as appropriate to bring the parameter back within the discharge criteria. ***If an upset condition in the FBR leads to high concentrations of perchlorate going into the lead ion exchange vessel and breaking through at the sample location between the vessels, the lag vessel will still remove perchlorate before it is discharged to Harrison Bayou, the INF Pond, or LHAAP-18/24.*** It is estimated that the lag ion exchange vessel can remove all of the perchlorate from two weeks of typical groundwater extraction at a concentration of 920 µg/L. If the residual perchlorate concentration after the FBR and lead ion exchange vessel is only 600 µg/L, the lag ion exchange vessel could last almost 2.5 years before perchlorate would be detected in the discharged effluent.

If a parameter exceeds the discharge criteria by more than 40% (see Appendix A-2, SAP, Section 7c of Monitoring and Reporting Requirements) or reaches 920 µg/L of perchlorate, then the GWTP will be put into full recycle mode (no discharge) until the parameter is below the discharge criteria again. Appendix A-2 of the SAP requires GWTP data to be provided to TCEQ monthly including a list of noncompliance(s), if applicable.

Discharge to Harrison Bayou

As shown in Figure 1, the GWTP effluent will be discharged to Harrison Bayou as long as it has a measurable flow. The flowrate in Harrison Bayou is estimated by measuring the height of water with a staff gauge and velocity in feet/sec at intervals along the width as described in the Installation-Wide Work Plan, Standard Operating Procedures, Attachment 18 – Water Depth and Velocity Measurements (AECOM, July 2014).

The allowable flow rate of GWTP effluent that can be discharged to Harrison Bayou is given by:

$$QE \leq \frac{QS\,(CC - CA)}{(CE - CC)}$$

where Q_E = GWTP effluent flow Q_S = Harrison Bayou flow

C_C = Criteria concentration (100 mg/L for chloride, 50 mg/L for sulfate)

C_A = Ambient concentration = 10 mg/L

C_E = Chloride or sulfate concentration in GWTP effluent

The allowable GWTP effluent flow will be the lower of the calculated values given the measured concentrations of chloride and sulfate in the discharge stream. For each day that GWTP effluent is discharged to Harrison Bayou, the measured Harrison Bayou flow, the allowable effluent flow, and the actual effluent flow are recorded.

Discharge to INF Pond

If Harrison Bayou is not flowing, then GWTP effluent will be discharged to the Intermediate-Range Nuclear Forces (INF) Pond for temporary storage until Harrison Bayou flow resumes. Perchlorate concentration detected in the effluent must be 17 µg/L or less, when this occurs.

The INF Pond has a flexible membrane liner protected by a soil cover with a gravity discharge pipe (and valve) to Harrison Bayou. The INF Pond has a nominal capacity of 3 million gallons with a staff gage to measure the height of water stored in the pond. The GWTP operator maintains the INF Pond by visually inspecting for erosion, vegetative growth including tree growth along the anchor trench, and liner integrity and making necessary repairs. Periodically, accumulated debris must be removed from the influent and effluent piping to the INF Pond.

Prior to discharging to the INF Pond, a lead and lag ion exchange vessel will be brought online. The GWTP Operator will also confirm that the discharge valve is closed, will record the reading on the effluent totalizer, and will record the height of water using the staff gage. The GWTP Operator will then configure valves and pumps to direct GWTP effluent to the INF Pond. The height of water in the INF Pond and totalizer reading will be recorded at the beginning and end of each shift for the duration of active discharge. When the height of water in the pond reaches 3 feet below the height of the berm (freeboard), the GWTP Operator will stop discharging to the INF Pond and TCEQ will be notified. After the TCEQ acknowledges the INF Pond level, GWTP effluent may be discharged to the INF Pond again until 2 feet of freeboard is reached. The GWTP Operator will stop discharging to the INF Pond and TCEQ will be notified again. After the TCEQ acknowledges 2 feet of freeboard in the INF Pond,GWTP effluent may be discharged again until 1 foot of freeboard remains. No additional GWTP effluent can be accepted at the INF Pond until greater than 1 foot of freeboard is measured.

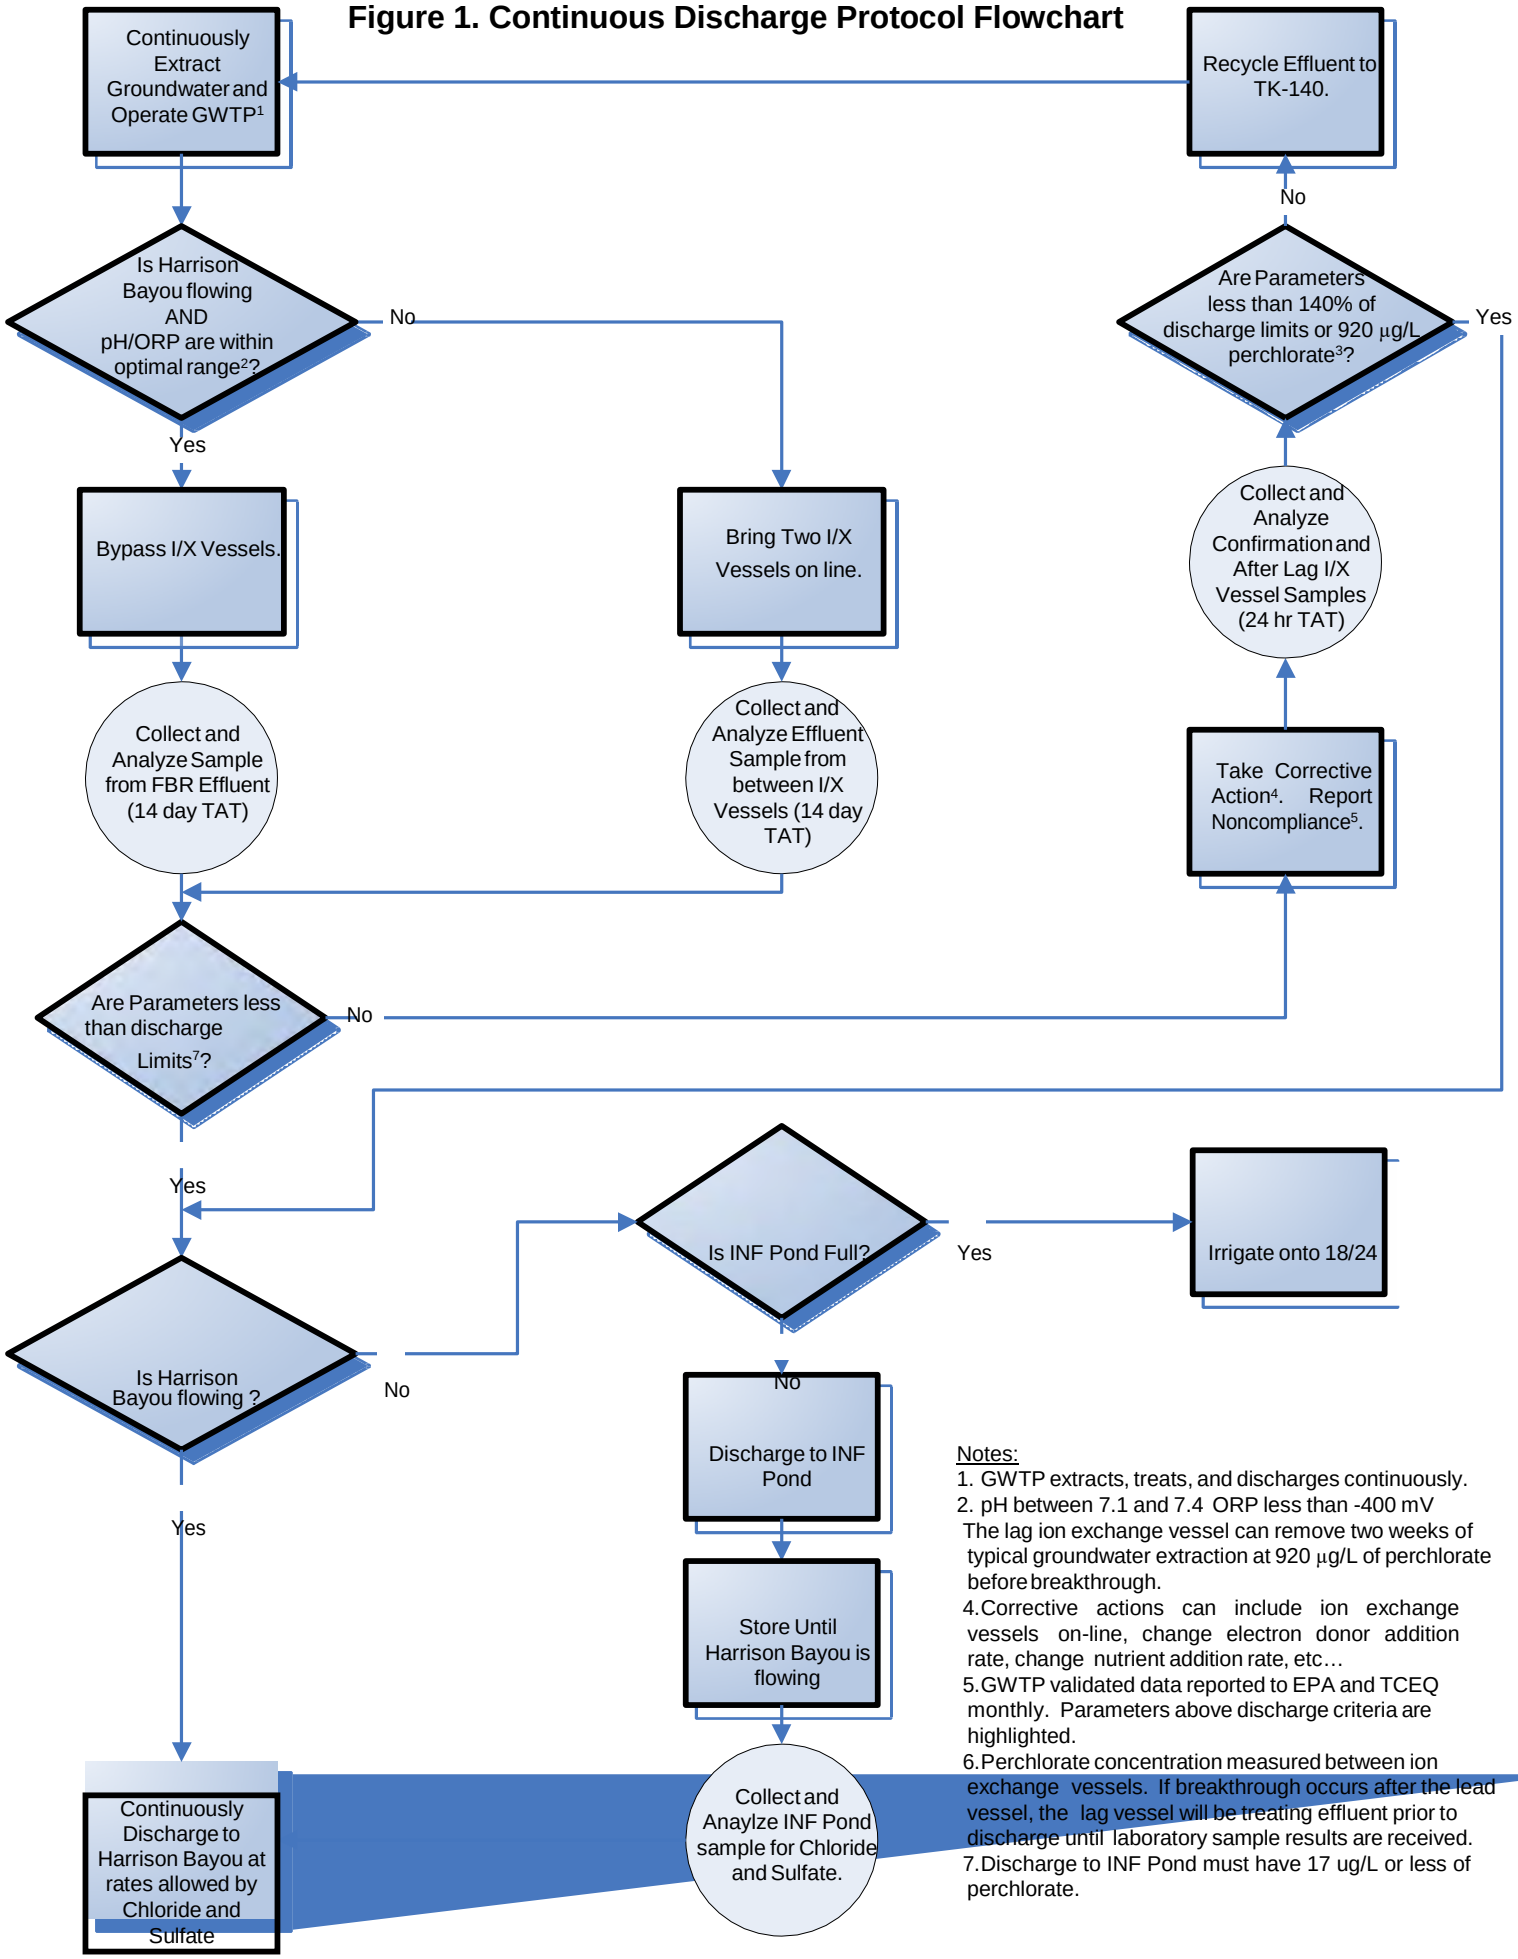
As soon as flow in Harrison Bayou returns, stored GWTP effluent from the INF Pond will be discharged. As with direct discharges from the GWTP to Harrison Bayou, the allowable flowrate of effluent from the INF Pond is calculated based upon the chloride and sulfate concentrations in the pond and the flow in Harrison Bayou. If effluent from the INF Pond and the GWTP are discharged simultaneously, total flow of both streams together should not exceed the calculated discharge level for either discharge location. For each day that INF Pond contents are discharged to Harrison Bayou, the measured Harrison Bayou flow, the allowable effluent flow, and the actual effluent flow are recorded.

Irrigation onto LHAAP-18/24

If Harrison Bayou is not flowing and the INF Pond has less than 1 foot of freeboard, then GWTP effluent will be irrigated onto LHAAP-18/24 using one of the three main sprinkler lines. To avoid pooling and runoff of irrigation water, only one line will be used for half a day at a time, with a separate line being used the second half of the day. If needed, the irrigation will occur 5 days a week for 8 hours each day (using 3 sprinklers in each line). If conditions are wet due to rain events, irrigation will not be conducted to avoid ponding and potential runoff, the GWTP will be put into recycle mode, and groundwater extraction will be interrupted if storage space is not available.

While irrigating, site inspections will be performed to ensure pooling and runoff are not occurring. During the irrigation activities, inspections will be performed twice a day, once approximately three hours and again approximately six hours into the 8-hour irrigation shift. The system will be inspected to ensure that the sprinkler heads are operating properly and not leaking large amounts of water. If ponding or runoff is observed, irrigation at that sprinkler line will cease, and irrigation at another sprinkler line will be started if possible. Volumes of GWTP effluent and twice daily inspections will be recorded daily and reported monthly until flow resumes in Harrison Bayou or greater than 1 foot of freeboard is available in the INF Pond.

Figure 1. Continuous Discharge Protocol Flowchart



Notes:

1. GWTP extracts, treats, and discharges continuously.
2. pH between 7.1 and 7.4 ORP less than -400 mV
   The lag ion exchange vessel can remove two weeks of typical groundwater extraction at 920 µg/L of perchlorate before breakthrough.
4. Corrective actions can include ion exchange vessels on-line, change electron donor addition rate, change nutrient addition rate, etc…
5. GWTP validated data reported to EPA and TCEQ monthly. Parameters above discharge criteria are highlighted.
6. Perchlorate concentration measured between ion exchange vessels. If breakthrough occurs after the lead vessel, the lag vessel will be treating effluent prior to discharge until laboratory sample results are received.
7. Discharge to INF Pond must have 17 ug/L or less of perchlorate.

		TOTAL		0.310												

Notes:

(1) Sample collected on February 27, 2019. The higher value of the sample or duplicate is reported.

(2) Based on a blower flow rate of 4,390 cubic feet per minute (cfm). Note that plant operations is less than or equal to 25 hours per week. 1/2 of detection limit was used for estimating mass rate

(2a) Based on operation of 25 hours per week, 52 weeks per year.

(3) Per 30TAC 106.533(f)(1)(B)

(4) Based on comparing the calculated air stripper stack sample emission rate in tons per year (tpy) to the allowable annual emission limit per chemical of 5 tpy.

(5) No Threshold Limit Values (TLVs) for these chemicals

(6) The maximum hourly limit allowed by 30 Texas Administrative Code (TAC) 106.262, per pollutant, is 6 pounds per hour (lb/hr) per "Figure 1: 30 TAC 106.262(a)". The E value was overridden with 6 lb/hr when the calculated E was higher.

(7) The maximum hourly emission rate allowed by 30 TAC 106.261(a)(3) for chemicals with a limit value (L) greater than 200 mg/m^3 is 1 lb/hr.

(8) Based on comparing the calculated air stripper stack sample emission rate in lb/hr to the allowable maximum emission limit per chemical based on distance downwind to nearest off-site receptor.

CAS # = Chemical Abstracts Service Number

mg/m^3 = milligrams per cubic meter

µg/m^3 = micrograms per cubic meter

U = non-detect

ACGIH = American Conference of Governmental Industrial Hygienists

Subject: Final Minutes, Quarterly Restoration Advisory Board (RAB) Meeting
Longhorn Army Ammunition Plant (LHAAP)
Location of Meeting: Karnack Community Center, Karnack, Texas
Date of Meeting: April 25, 2019, 5:00-5:40 PM Central Daylight Time (CDT)

Meeting Participants:

Army BRAC:	Rose M. Zeiler
USACE:	Aaron Williams and John Doran
USAEC:	Andrew Maly
USGS:	Kent Becher
Bhate:	Kim Nemmers
APTIM:	William (Bill) Foss
USEPA Region 6:	Rich Mayer, Dorelle Harrison, and Janetta Coats
TCEQ:	April Palmie
USFWS:	Eric Duerkop
RAB:	Present: Judy VanDeventer, Paul Fortune, Carol Fortune, Charles Dixon, and Richard LeTourneau Absent: Terry Britt; John Pollard, Jr.; Tom Walker; and Nigel R. Shivers
Public:	Laura-Ashley Overdyke (Executive Director of the Caddo Lake Institute [CLI]), George Rice (CLI), John Fortune (New RAB Member), Sharron McAvoy (New RAB Member), Deon Hall (New RAB Member) Brad Eskue, Robert Speight, and James Saunders

An agenda for the RAB meeting, a color copy of the Bhate Environmental Associates, Inc. (Bhate) slide presentation, and handouts (see list at end of meeting minutes) were provided for meeting attendees.

Welcome and Introduction

Mr. Paul Fortune, RAB Installation Co-Chair, called the RAB meeting to order at 5:05 pm CDT. Mr. Fortune welcomed everyone and asked if there was anyone present that had not attended before. Mr. Aaron Williams stated that Mr. John Doran was new to the RAB Meeting. Mr. Doran stated that he was with the United States Army Corps of Engineers (USACE) and was assisting Mr. Williams on the project and had been with the USACE for about 6 months.

Ms. Rose M. Zeiler welcomed everyone and explained the purpose of the RAB meeting. Ms. Zeiler explained that the meeting is held every 3 months and then presented the mission for the RAB. Ms. Zeiler stated that it is important for everyone to ask questions or provide comments and that you can just raise your hand or speak up when you need to.

Administrative

Ms. Zeiler stated that there are three RAB applicants, who were John Fortune, Sharron McAvoy, and Deon Hall. Ms. Zeiler stated that ballots should have been handed out to RAB members. Ms. Zeiler emphasized how great it was that there were three applicants. Ms. Zeiler then explained that the charter calls for a vote and requires a 2/3 majority for approval. Two of the three

applicants were present and were asked to stand up. Mr. Hall was not present. Mr. John Fortune was one of the interested RAB members and explained that he had grown up in Karnack, worked at the Army Ammunition Plant for Thiokol and had recently moved back and wanted to participate. Ms. Sharron McAvoy stated her interest in environmental protection and that she was a member of the Sierra Club. Ms. Zeiler asked for the votes to be handed to her during the meeting. **Note:** votes were tallied by Mr. Paul Fortune and Ms. Zeiler at the end of the RAB Meeting, when it was announced that each of the three applicants were approved as new RAB members.

Open Items

Ms. Zeiler noted that the RAB Meeting minutes had been sent out in November 2018. Ms. VanDeventer made a motion to accept the October 2018 RAB Meeting minutes. Mr. Fortune seconded the motion. (**Note:** no meeting was held in January 2019 due to the partial Government shutdown).

Ms. Zeiler then reminded everyone of the ongoing outreach with the website address listed in the slide packet. Ms. Zeiler stated that the meeting minutes, ongoing activities, and information by site are on the website as well as the administrative record.

Defense Environmental Restoration

Ms. Kim Nemmers reminded everyone that copies of the slides were available and that Bhate's role was to manage most of the sites as a contractor with the exception of LHAAP-29, LHAAP-18/24, and LHAAP-47. Ms. Nemmers then pointed out the slide with the acronyms and reviewed the agenda for the meeting. Ms. Nemmers then stated that three sites will be discussed by Mr. Bill Foss.

LHAAP-03

Mr. Foss provided an update on LHAAP-03, which was discussed about a year ago. Mr. Foss stated that LHAAP-03 is a very small site that was a former waste collection pad outside of the paint shop building. Site soils are contaminated with lead and arsenic. The Record of Decision (ROD) selected a remedy of excavation. Mr. Foss explained that additional soil samples were collected in November 2018 to both narrow down what area needed to be excavated and to determine if lateral or vertical delineation could be achieved to eliminate some of the confirmation sampling following excavation. Mr. Foss stated that a Remedial Design (RD)/ Remedial Action Work Plan (RAWP) was prepared using the older data and the data collected in November 2018. The RD/RAWP is currently in Army review. Mr. Foss stated that the plan is to excavate in late summer/early fall 2019. Mr. Foss explained that the map shows the area of excavation but noted that the scale makes it look like a large area. Mr. Foss also pointed out that much of the excavation is only down to 2 to 3 feet below ground surface (bgs). Mr. Foss explained that the yellow dots were the November 2018 samples.

LHAAP-04

Mr. Foss stated that LHAAP-04 is the location of a former pilot Wastewater Treatment Plant. In 1997, the structures were demolished. Then soil excavation was completed in 2009 for mercury and perchlorate contamination. The ROD selected a remedy for perchlorate treatment. Mr. Foss

explained that the first thing completed under Bhate's contract was to install monitoring wells and collect samples. The results indicated that the plume appeared to have shifted. So, the Army provided a scope of work to complete additional sampling. Mr. Foss explained that the plume used to be centered around monitoring well 04WW04. However, 04WW05 had perchlorate detections that increased. So, this indicated that the plume may have shifted to the west. The yellow circles are the additional data collected via direct push technology to evaluate the lithology and grab a groundwater sample. Then three new wells were installed based upon the data (04WW09, 04WW10, and 04WW11). The center of the mass of the plume did shift and this information was used to develop the RD. Mr. Foss explained that the RD will use in-situ bioremediation (ISB) which uses bacteria to degrade the contaminants. Mr. Foss explained that 25 direct push points will be advanced to allow for a little over 1,400 gallons of injectate (emulsified vegetable oil [EVO], nutrients, and water) to be added. Monitoring will be completed to evaluate the injections and RD. Land use controls (LUCs) will also be monitored which basically does not allow for groundwater use except for the environmental groundwater sampling. LUCs also restrict land use to prevent residential use. Mr. Foss then showed the location of the injection points and pointed out that the target area is where the contamination is 5 times the cleanup level (hot spot) and then there are a few locations to the south and west based upon the known plume migration. Mr. Foss stated that the RD was approved so the plan is to do the work in June or July 2019. Mr. Richard LeTourneau asked about backfilling. Mr. Foss stated that the site will be backfilled with soil that is either certified clean or sampled for offsite laboratory analysis to verify that the soil does not contain any contaminants above cleanup levels. Ms. Zeiler stated that this site had a substantial excavation previously.

LHAAP-17

Mr. Foss explained that LHAAP-17 was a former burning ground and flashing ground near the groundwater treatment plant (GWTP) and site LHAAP-18/24. The site was used for burning of TNT and flashing of powder. The waste was removed in the 1980s but contamination remains. Mr. Foss explained that the contaminants are mostly explosives, perchlorate, and solvents. The ROD that was signed in 2016 included groundwater extraction for the large perchlorate plume that has concentrations that are restrictive to natural attenuation. Mr. Foss explained that soil excavation of the explosives contaminated area will also be completed. Monitoring will be completed to evaluate the remedy, and LUCs will remain. Ms. Zeiler stated that there is a contingent remedy. Mr. Foss stated that the contingent remedy will apply if the reduction of perchlorate has not occurred in 18 months and includes another active remediation ahead of monitored natural attenuation.

Mr. Foss stated that previously the presentations at the RAB included a briefing on the pre-design investigation that included an aquifer pumping test and soil and groundwater sampling. The pumping test provided the basis for the type of system to install. The soil sampling provided the extent of soil requiring excavation. Based upon that information, the RD includes approximately 5,300 cubic yards of soil that is mostly 2 to 3 feet bgs. The excavation depth will be controlled by groundwater depth because soil excavation will not extend into the groundwater, which is expected to be at 7 feet bgs. Groundwater extraction will include up to three wells and will run for 18 months. The extracted groundwater will be piped to the GWTP. The contingent remedy

will be used if the perchlorate remains above 20,000 parts per million (ppm) following the extraction for 18 months. Mr. Foss explained that monitoring of the remedy will be completed and that LUCs will be in place. Mr. Foss stated that the LUCs prohibit groundwater use and limit site usage due to the perchlorate.

Mr. Foss explained the slide with the soil excavations. Mr. Foss stated that the areas furthest out from the site boundary were being excavated due to ecological concerns. The other deeper areas are due to explosives such as TNT. Mr. Foss then pointed out the deeper areas that were determined based upon the historic data as well as the newer data collected. Mr. Foss then showed the potential wells that will be used for groundwater extraction. Mr. Foss stated that wells 17WW02 and 17WW06 will be used for extraction. Groundwater results from 17WWW01 will determine if that well is brought online for extraction also. Mr. Foss explained the purple line is the current perchlorate plume.

Overview of Sites

Ms. Zeiler explained that several remedies are being implemented this summer. Mr. Foss stated that the areas need to dry-up following all the rain this winter/spring. Ms. Zeiler stated that the website would have a schedule of the work.

Ms. Nemmers explained that field work is completed, and then a report is prepared with that information. Also, remedial action operation (RA-O) sampling is completed semi-annually at a minimum. Ms. Nemmers explained that RA-O sampling is primarily sampling of monitoring wells to evaluate the remedy once it is in place. Ms. Nemmers stated that the ion exchange vessels at the GWTP were replaced and that the ion exchange is used to ensure that there is no perchlorate in the GWTP effluent.

Ms. Nemmers stated that the ongoing documents include the RD/RAWP for LHAAP-03 that Mr. Foss discussed. Ms. Nemmers stated that even though quite a bit of sampling has occurred, the list of documents for the sites are minimal because the reports are not written until additional sampling events are completed.

For the 3 month look ahead, Ms. Nemmers presented the four sites planned for field work (LHAAP-03, LHAAP-04, LHAAP-16, and LHAAP-17) in July or August and explained soil excavation will be conducted at two of the sites (LHAAP-03 and LHAAP-17). Ms. Nemmers explained that the schedule will be dependent upon the weather and that work will be moved up if possible.

Groundwater Treatment Plant

Ms. Nemmers stated that there were handouts with the information on the slides for the GWTP as well as handouts for the RDs of LHAAP-04 and LHAAP-17. Ms. Nemmers stated that the chart had a couple of dips since that last RAB meeting, which is due to power issues to the GWTP. Currently, the GWTP is on a generator. Ms. Judy VanDeventer asked if the site used Southwestern Electric Power Company (SWEPCO) to which Ms. Nemmers stated that the GWTP does use SWEPCO. Ms. VanDeventer pointed out that there has been power loss more frequently as of late from SWEPCO. Ms. Nemmers stated that the site has not been affected recently because it is pulling its power from the generator. Ms. Nemmers then pointed out that you will

see a big jump in water processed the next month following power outage because the GWTP operators are working to fix pumps and motors while the GWTP is not operating.

Surface Water Sampling

Ms. Nemmers presented the five locations sampled for surface water and stated that results are usually non-detect and well below the action level.

LHAAP-18/24, LHAAP-29 and LHAAP-47

Mr. Williams explained that a separate contractor, HDR, is responsible for developing the Proposed Plan (PP) for the preferred remedy followed by the ROD for LHAAP-18/24, LHAAP-29, and LHAAP-47. For LHAAP-18/24, the PP was finalized in February and the public meeting is after the RAB meeting. Mr. Williams encouraged everyone to stay stating that LHAAP-18/24 is considered to be the most contaminated site at Longhorn. Mr. Williams stated that the comment period goes through May 2, 2019. Mr. Williams stated that the expectation is to have the ROD drafted by September 2019. Ms. Zeiler then stated that no comments had been received yet.

Mr. Williams explained that the LHAAP-29 PP was finalized and the public meeting was held in December 2018. The ROD has been submitted to the regulators for review.

Mr. Williams stated that the LHAAP-47 Post-Screening Investigation data had been shared at the last RAB meeting in October 2018. Mr. Williams explained that many of the shallow wells are now dry and thus the plume has shrunk. In the intermediate wells, there are somewhat higher hits but overall the remedy remains the same. Therefore, Mr. Williams stated that the remedy remains the same and so a revision to the Draft Final ROD is being prepared for submittal to the regulators in August 2019.

Mr. Williams stated that in addition to the PP that is online you can also review the Final Revised Feasibility Study (FS) that details all of the remedial alternatives evaluated for LHAAP-18/24. The FS is in the administrative record.

Mr. Williams stated that some surface water sampling needed to be completed for LHAAP-47, which was completed in March 2019. The results are either non-detect or below the cleanup levels.

Next RAB Meeting Schedule and Closing Remarks

Ms. Zeiler then discussed the next meeting with the RAB members. It was decided that the next RAB Meeting will be held on **July 25, 2019,** with the **meeting starting at 6:00 pm CDT** at the Karnack Community Center.

Adjourn

Ms. VanDeventer made the motion to adjourn, and Mr. Paul Fortune seconded the motion. The meeting adjourned at 5:41 pm CDT.

April 2019 Meeting Attachments and Handouts:

- Meeting Agenda
- Color Copy of Bhate Presentation Slides
- Groundwater Treatment Plant (GWTP) – Processed Groundwater Volumes Handout
- Surface Water Sampling Handout
- Remedial Design Handout for LHAAP-17 and LHAAP-04

- LHAAP-47 Pre-Screening Investigation (PSI) Update
- Five Year Review Update

05:55 Next RAB Meeting Schedule and Closing Remarks {RMZ}

Restoration Advisory Board Meeting

Purpose of the RAB Meeting

- Held every 3 months
- The mission of the Longhorn Army Ammunition Plant (LHAAP) RAB is to promote community awareness and obtain constructive community review and comments on environmental restoration activities at the former LHAAP

Restoration Advisory Board Meeting

The Army Wants You to be Informed

- The Army is committed to protecting human health and the environment; key to that commitment is engaging the community and increasing public participation in environmental restoration at LHAAP

- You are encouraged to:
  - Attend RAB Meetings and/or become a member of the RAB
  - Visit the Longhorn environmental website at www.longhornaap.com
    - Website is regularly updated to indicate the upcoming field events at each site including groundwater sampling, monitoring well installations, soil sampling, or remediation activities
  - Make suggestions for improving communication – the Army welcomes and appreciates community feedback

Restoration Advisory Board Meeting

RAB Administrative Issues

- RAB Membership
- Discussion of October 2018 RAB Meeting minutes/motion to accept

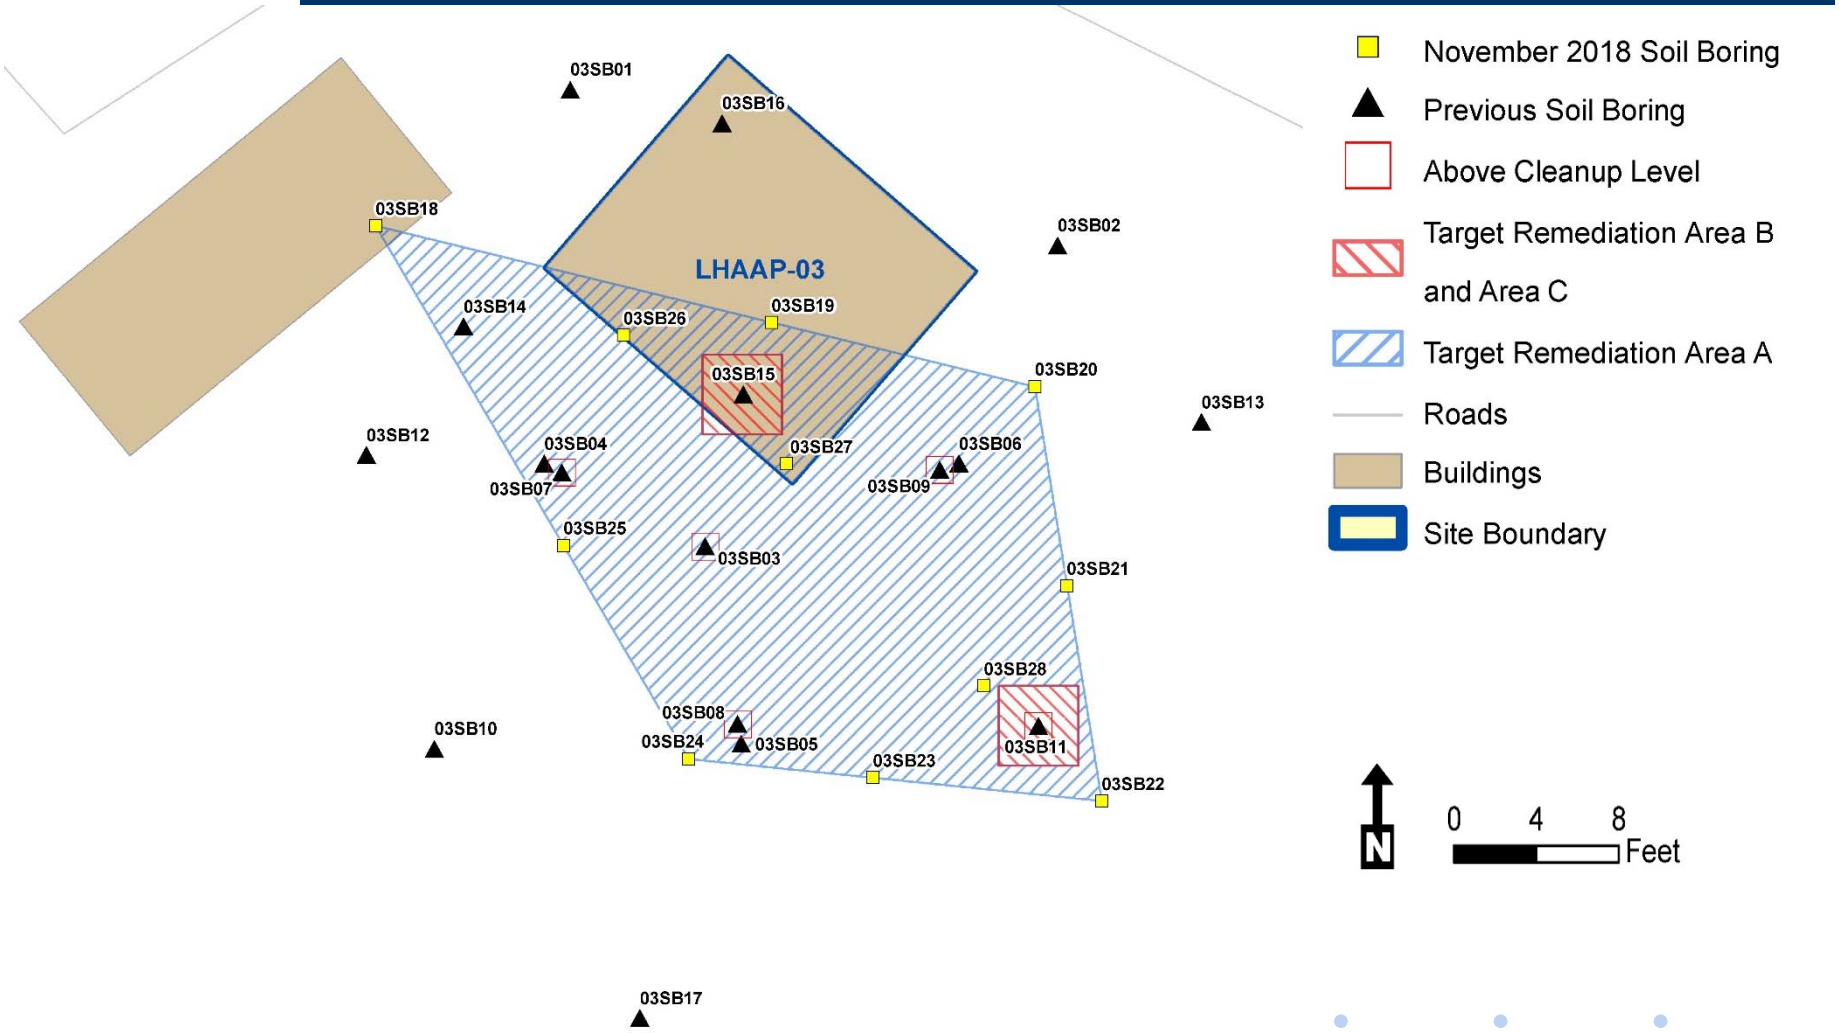
Restoration Advisory Board Meeting

LHAAP-03 Pre-Excavation Soil Sampling

- **Site Background**
  - LHAAP-03 is the site of a former Waste Collection Pad for the Building 722-P Paint Shop
  - Building 722-P and the surrounding structures have been demolished
  - Soil is contaminated with arsenic and lead at concentrations that could be a risk to groundwater and the ROD selected excavation and offsite disposal as the remedy
  - Groundwater is being addressed as part of site LHAAP-35A(58)
- **Recent Activities**
  - Pre-excavation soil samples were collected in late November 2018 from locations surrounding the excavation area defined in the ROD
  - Samples were used to better define the area where excavation is required
  - Soil sample data will be included in the Remedial Design (RD) and Remedial Action Work Plan (RAWP)
  - RD/RAWP is currently in preparation for submittal to the U.S. Environmental Protection Agency (USEPA) and Texas Commission on Environmental Quality (TCEQ)

Restoration Advisory Board Meeting

LHAAP-03 Pre-Excavation Soil Sampling



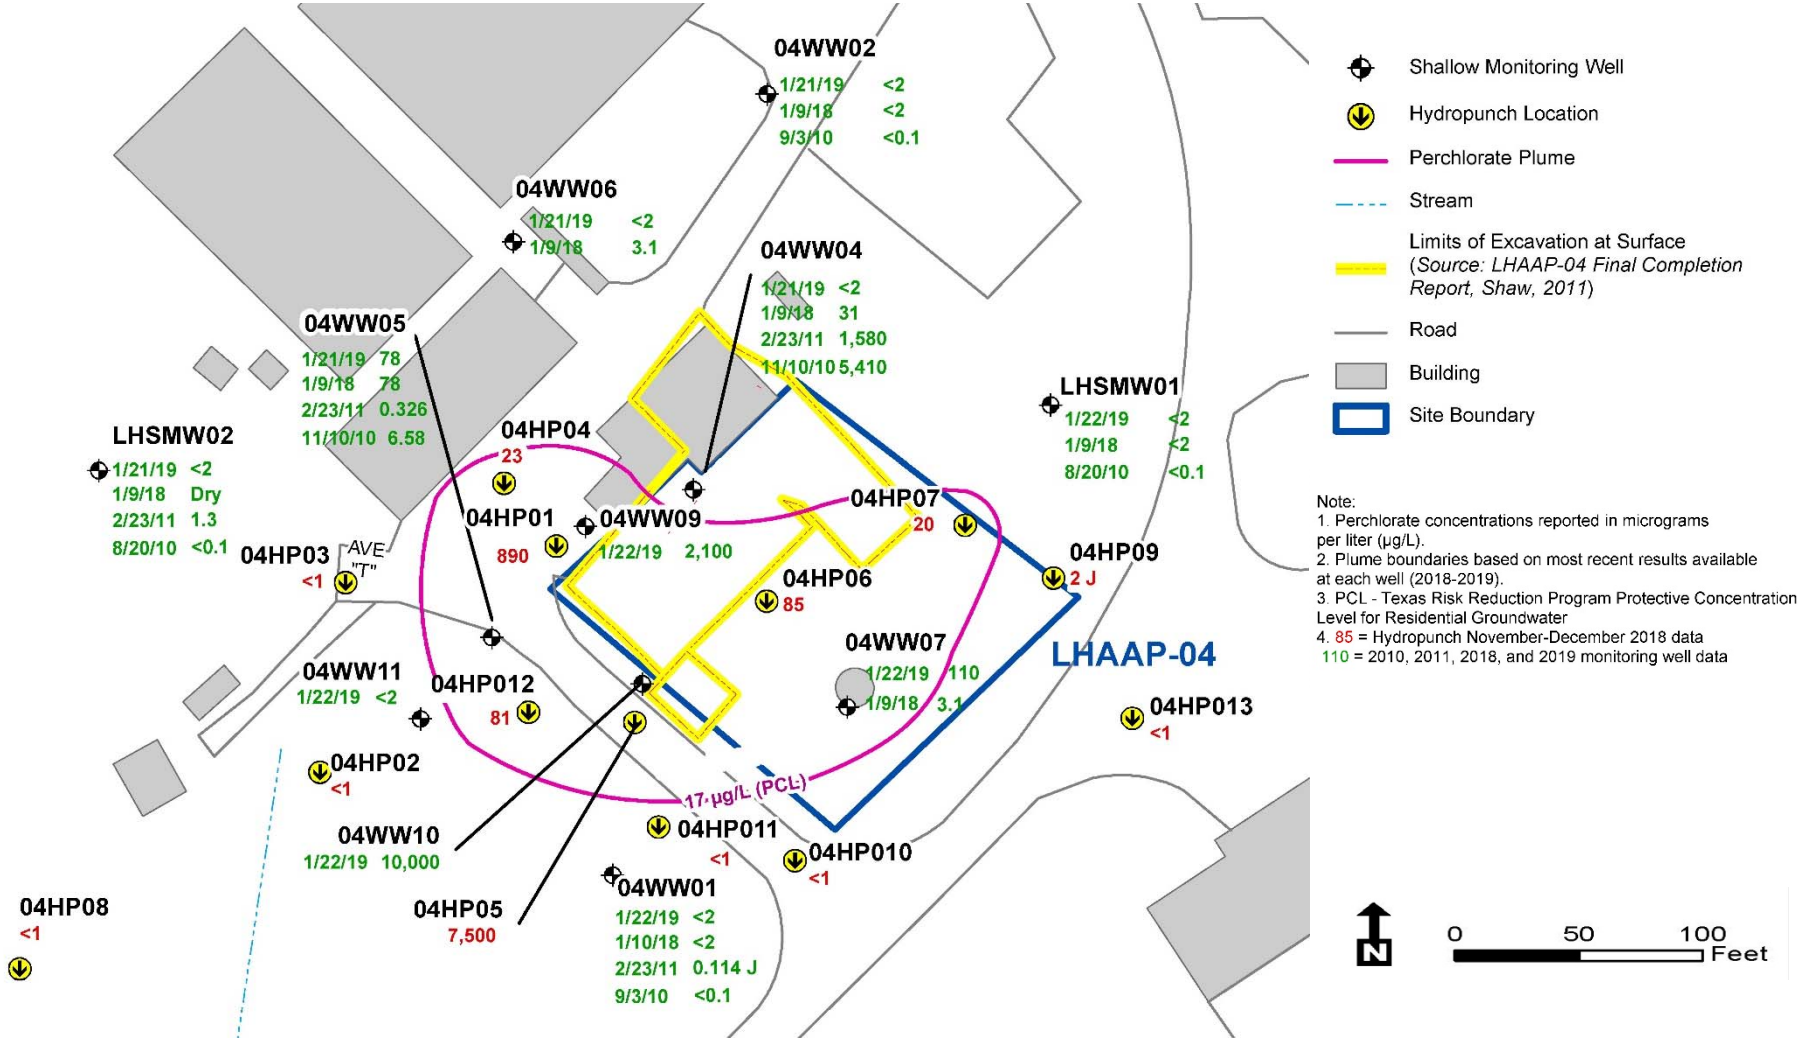
Restoration Advisory Board Meeting

LHAAP-04 Remedial Design

- **Site Background**
  - LHAAP-04 is the site of the former Pilot Wastewater Treatment Plant, located near the former Fire Station
  - Demolition of the structures and disposal of associated wastes was conducted in 1997
  - Soil contaminated with mercury and perchlorate was excavated in 2009
  - The ROD published in October 2016 selected In-Situ Bioremediation (ISB), Long-Term Monitoring, and Land Use Controls (LUCs) as the remedy for groundwater
- **Recent Activities**
  - Groundwater sampling in January 2018 revealed that the groundwater plume may have migrated since the previous sampling in 2010-2011
  - Additional direct-push groundwater sampling was performed in November-December 2019 and additional monitoring wells were installed in January 2019
  - January 2019 sampling of the new and existing wells confirmed that the plume had migrated slightly to the southwest, but is still adequately delineated

Restoration Advisory Board Meeting

LHAAP-04 2010-2019 Perchlorate Data



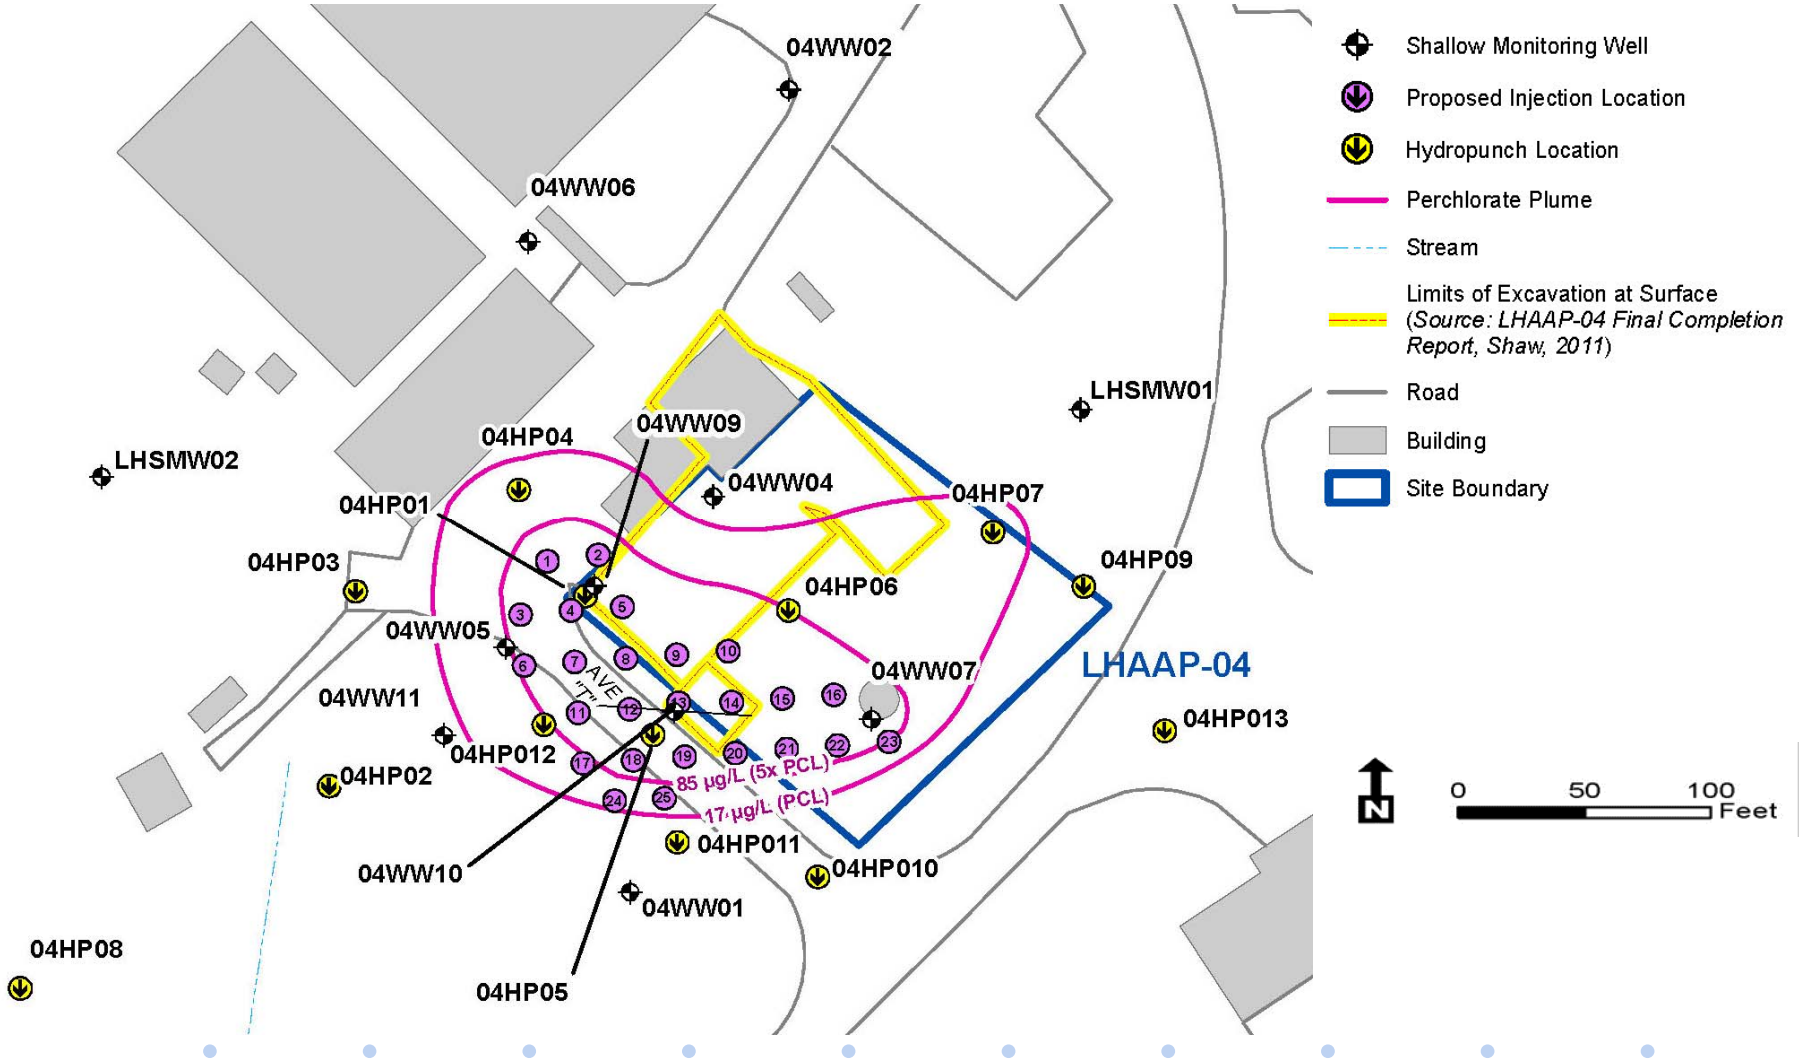
Restoration Advisory Board Meeting

LHAAP-04 Remedial Design

- **Remedial Design**
  - ISB will be implemented for the hot-spot defined as 5 times the Texas Risk Reduction Program (TRRP) Protective Concentration Level (PCL) for Residential Groundwater (17 micrograms per liter [µg/L])
  - 25 direct push injection locations will be used to inject emulsified vegetable oil (EVO)
  - Each location will receive approximately 15 gallons of EVO, 6 gallons of nutrients, and 1,463 gallons of water to treat a radius of approximately 10 feet around the location
  - Injection grid is spaced approximately 20-25 feet apart and shifted slightly to the south and west to account for future migration of the plume
- **Long-Term Monitoring and LUCs**
  - Baseline sampling of all site wells prior to injections, quarterly sampling for the first 2 years, semi-annual sampling for years 3 through 5, and annual sampling thereafter
  - LUCs include prohibition on use of groundwater (except for environmental monitoring), restriction to non-residential land use, and maintenance of remediation and monitoring systems
  - LUCs will remain in place until the concentration of perchlorate allows for unrestricted use and unlimited exposure

Restoration Advisory Board Meeting

LHAAP-04 Injection Plan



Restoration Advisory Board Meeting

LHAAP-17 Remedial Design

- **Site Background**
  - **LHAAP-17 is the site of the former Burning Ground No. 2/Flashing Ground used from 1959 to 1980 for burning of bulk TNT, photo flash powder, and reject material from Universal Match Corporation**
  - **Waste material was reportedly removed from the burning trenches in 1984**
  - **Contaminants include explosives and metals in soil, and perchlorate and chlorinated solvents in groundwater**
  - **The ROD published in August 2016 selected Groundwater Extraction, Monitored Natural Attenuation (MNA), Soil Excavation, Long-Term Monitoring, and LUCs as the remedy**
- **Recent Activities**
  - **Pre-Design Investigation (PDI) (aquifer pumping test and soil and groundwater sampling) conducted in January 2018**
  - **Groundwater sampling to assess current plume conditions**
  - **Soil sampling refined the extent of the soil contamination requiring excavation**
  - **Aquifer pumping test provided design basis for the groundwater extraction system design**

Restoration Advisory Board Meeting

LHAAP-17 Remedial Design

- **Remedial Design**
  - Approximately 5,300 in-place cubic yards of soil will be excavated based on the previous soil sampling data and transported to an offsite licensed disposal facility
  - Excavation will be backfilled with clean soil once sampling confirms contaminated soil has been removed
  - Groundwater extraction will be conducted for 18 months in up to three wells to reduce perchlorate concentrations to less than 20,000 µg/L
  - MNA will be the remedy for chlorinated solvents and perchlorate in groundwater unless perchlorate remains above 20,000 µg/L
- **Long-Term Monitoring and LUCs**
  - Extraction: Baseline sampling prior to extraction, monthly sampling for first 6 months of extraction, quarterly sampling for last 12 months of extraction
  - MNA: quarterly sampling for the first 2 years, semi-annual sampling for years 3 through 5, and annual sampling thereafter
  - LUCs include prohibiting use of groundwater (except for environmental monitoring), restricting land use to non-residential, and maintaining remediation/monitoring systems
  - LUCs will remain in place until the concentration of perchlorate allows for unrestricted use and unlimited exposure

Re: Draft Final Addendum Post Screening Investigation Report, LHAAP-47, Longhorn Army Ammunition Plant, Karnack, Texas, June 2019

Dear Mr. Mayer,

Two hard copies (HC) and two compact discs (CDs) of the above-referenced document are being transmitted to you for your records. The document includes revisions based upon the Environmental Protection Agency's (EPA) comments on the Draft received July 12, 2019. In accordance with the Federal Facility Agreement, this Draft Final will be considered Final after 30 days without further comment. Response to comments on the Draft version of the document are included within this Draft Final.

The document was prepared by HDR Environmental, Operations and Construction, Inc. (HDR) on behalf of the Army as part of HDR's contract for the facility. I ask that Phil Werner, HDR's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

1 Introduction

This addendum to the Post-Screening Investigation (PSI) Report has been prepared for the former Longhorn Army Ammunition Plant (LHAAP) site LHAAP-47 (Plant 3 Area), located in Karnack, Texas. The purpose of this addendum is to summarize the results of the surface water sample collection and analysis performed at LHAAP-47 in March and April 2019. Due to drought conditions and the lack of surface water in Goose Prairie Creek and its tributaries during the summer of 2018 when the PSI field investigation was conducted, surface water sampling could not be performed. The decision was subsequently made to perform this activity when surface water was present and could be attributed to groundwater recharge and not overland flow from precipitation events.

This document describes the PSI activities completed at site LHAAP-47. The PSI effort was performed in accordance with the Installation Wide Work Plan (IWWP) (AECOM, 2014) and PSI Work Plan (WP) (AECOM, 2016). The IWWP and PSI WP were reviewed by and concurrence was obtained from the Texas Commission on Environmental Quality (TCEQ) and the U.S. Environmental Protection Agency (USEPA).

The objective of the surface water sampling is to re-assess and update the LHAAP-47 groundwater contribution to surface water in Goose Prairie Creek. The addendum PSI data will be used to support revision of the Draft Final Record of Decision (ROD), as necessary.

2 Investigation Activities

This section presents information on the activities completed at LHAAP-47 to re-assess the current surface water conditions. The following provides a description of the activities completed to collect and analyze surface water samples from Goose Prairie Creek.

Surface water samples were collected on 7 March 2019, as part of the PSI surface water re-assessment. Four samples were collected at various locations in Goose Prairie Creek and its tributaries, as shown on **Figure 2-1**. The surface water samples were analyzed for volatile organic compounds (VOCs) and perchlorate to assess whether contaminated groundwater was impacting surface water. Additionally, water quality parameters were collected at each sampling location using an YSI 556 water quality meter and a Hanna Turbidimeter. **Table 2-1** presents the water quality parameters collected at each surface water location.

To evaluate whether groundwater was contributing to surface water, water levels were gauged in nearby wells, while creek bottom elevations were collected at each sample location (as shown in **Table 2-2**). Water level measurements were collected in accordance with the procedures identified in the IWWP and PSI WPs from the up gradient wells.

Creek bottom elevations were collected using a Trimble R2 Global Positioning System (GPS) receiver receiving real-time corrections from a Virtual Reference Station (VRS) subscription. At each sample location, the R2 receiver, which was mounted on a 2-meter survey pole, was placed in the center of the creek. The survey pole was set up using a tripod and leveled properly. The field team then collected several points at each location, those with the highest accuracy metrics were used for the final creek bottom elevations. A second mobilization was conducted 25 April 2019 to revisit creek bottom elevations at sample location SW2 due to abnormal readings collected in March. It was determined that elevation readings were collected while the receiver was in roving mode, which did not fix an accurate elevation. The coordinate data collected from the other three surface water sample locations were confirmed they were collected in fixed mode and did not need reassessment.

Prior to collecting GPS data, the system was verified to be working properly by collecting a coordinate on an established survey monument (monument C-22) near the sampling areas. The coordinate data comparison for this verification is shown in **Table 2-2**. The location of the C-22 monument is shown on **Figure 2-1**.

3 Investigation Findings

This section presents sample results from the PSI surface water field investigation. The surface water results presented in this section have been compared to Safe Drinking Water Act (SDWA) Maximum Contaminant Levels (MCLs), where they exist. Where an MCL has not been promulgated, the Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Levels (PCL) ($^{GW}GW_{Ing}$) (TRRP Groundwater PCL) comparison levels were used. Surface water results are discussed in relation to these screening levels. The results of the sampling and analyses are discussed below.

General observations of the surface water conditions and creek morphology were recorded during sampling. Field activities were completed under sunny skies; the previous rain event had occurred three days prior to sample collection. In general, surface water was found to be cloudy with low laminar flow at locations with deeper water. In areas with shallow water, the water appeared clear with slightly more turbulent flow. Since sampling was performed post-winter, tree foliage was minimal and all sample locations were surrounded by heavy woods and dense branch cover. Creek bottoms were very sandy at all locations except SW2, which was very rocky. Samples were collected in one day; weather conditions were overcast, damp, and cool with no measurable precipitation.

Four surface water and one duplicate sample were collected and submitted to MicroBac Laboratories for perchlorate and VOC analyses. Perchlorate was detected at each surface water location at low concentrations, well below the TRRP Groundwater PCL value of 17 micrograms per liter (µg/L). Acetone was detected in three of the four samples collected, plus the duplicate sample. These values were qualified as estimated, with possible high bias (J+), due to acetone detections in the associated trip blanks. The detections, however, were well below the TRRP Groundwater PCL value of 22,000 µg/L. Trichloroethene was detected at one surface water sample location at an estimated value of 0.373 µg/L below the MCL. No other VOCs were detected in any of the surface water samples. A summary of the sample results are provided in **Table 3-1** presented below.

A comparison of the creek bottom elevations to the groundwater elevations identified that groundwater near surface water location SW1 was higher than the creek bottom and was likely contributing to surface water flow. Groundwater elevations at all other surface water locations were found to be lower than the creek bottom elevations.

Table 3-1. Surface Water Results

Chemical Abstracts Service Number	Chemical Name	Sample ID	SW1	DUP1	SW2	SW3	SW4
		Collection Date	03/07/2019				
		Compliance Levels (µg/L)

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

Description	Yes	No	NA	NR	ER#
Chain-of-custody (C-O-C)					
Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
Were all departures from standard conditions described in an exception report?	X				
Sample and quality control (QC) identification	X				
Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
Test reports					
Were all samples prepared and analyzed within holding times?	X				
Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
Were calculations checked by a peer or supervisor?	X				
Were all analyte identifications checked by a peer or supervisor?	X				
Were sample detection limits reported for all analytes not detected?	X				
Were all results for soil and sediment samples reported on a dry weight basis?	X				
Were % moisture (or solids) reported for all soil and sediment samples?	X				
Were bulk soils/solids samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
If required for the project, are TICs reported?			X		
Surrogate recovery data					
Were surrogates added prior to extraction?	X				
Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
Test reports/summary forms for blank samples	X				
Were appropriate type(s) of blanks analyzed?	X				
Were blanks analyzed at the appropriate frequency?	X				
Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
Were blank concentrations < MQL?	X				
Laboratory control samples (LCS):					
Were all COCs included in the LCS?	X

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L19030638
Project Name:		**Method:**	8260
Prep Batch Number(s):		**Reviewer Name:**	Anthony Canter
LRC Date:	2019-03-25 00:00:00		

Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
Were LCSs analyzed at the required frequency?	X				
Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
Was the LCSD RPD within QC limits?	X				
Matrix spike (MS) and matrix spike duplicate (MSD) data					
Were the project/method specified analytes included in the MS and MSD?			X		
Were MS/MSD analyzed at the appropriate frequency?			X		
Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		
Were MS/MSD RPDs within laboratory QC limits?			X		
Analytical duplicate data					
Were appropriate analytical duplicates analyzed for each matrix?			X		
Were analytical duplicates analyzed at the appropriate frequency?			X		
Were RPDs or relative standard deviations within the laboratory QC limits?			X		
Method quantitation limits (MQLs):					
Are the MQLs for each method analyte included in the laboratory data package?	X				
Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
Other problems/anomalies					
Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
Was applicable and available technology used to lower the SDL to minimize the matrix interference effects on the sample results?	X				
Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				
Initial calibration (ICAL)					
Were response factors and/or relative response factors for each analyte within QC limits?	X				
Were percent RSDs or correlation coefficient criteria met?	X				

Microbac

Texas Risk Reduction Program (TRRP) Checklist

Laboratory Name:	Microbac OVD	**Laboratory Log Number:**	L19030638
Project Name:		**Method:**	8260
Prep Batch Number(s):		**Reviewer Name:**	Anthony Canter
LRC Date:	2019-03-25 00:00:00		

Was the number of standards recommended in the method used for all analytes?	X				
Were all points generated between the lowest and highest standard used to calculate the curve?	X				
Are ICAL data available for all instruments used?	X				
Has the initial calibration curve been verified using an appropriate second source standard?	X				
Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB):					
Was the CCV analyzed at the method-required frequency?	X				
Were percent differences for each analyte within the method-required QC limits?	X				
Was the ICAL curve verified for each analyte?	X				
Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
Mass spectral tuning					
Was the appropriate compound for the method used for tuning?	X				
Were ion abundance data within the method-required QC limits?	X				
Internal standards (IS)					
Were IS area counts and retention times within the method-required QC limits?	X				
Raw data (NELAC Section 5.5.10)					
Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
Were data associated with manual integrations flagged on the raw data?	X				
Dual column confirmation					
Did dual column confirmation results meet the method-required QC?			X		
Tentatively identified compounds (TICs)					
If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
Interference Check Sample (ICS) results					
Were percent recoveries within method QC limits?			X		
Serial dilutions, post digestion spikes, and method of standard additions					
Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
Method detection limit (MDL) studies

2.1.1.2 QC Summary Data

Example 8260 Calculations

1.0 Calculating the Response Factor (RF) from the initial calibration (ICAL) data:

RF = [(Ax) (Cis)] / [(Ais) (Cx)]

where:	Example
Ax = Area of the characteristic ion for the compound being measured:	3399156
Cis = Concentration of the specific internal standard (ug/mL)	25
Ais = Area of the characteristic ion of the specific internal standard	846471
Cx = Concentration of the compound in the standard being measured (ug/mL)	100
RF = Calculated Response Factor	**1.0039**

2.0 Calculating the concentration (C) of a compound in water using the average RF: *

Cx = [(Ax) (Cis) (Vn)(D)] / [(Ais) (RF) (Vs)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Vs = Purge volume of sample (mL)	**10**
Vn = Nominal purge volume of sample (mL) (10.0 mL)	**10**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

3.0 Calculating the concentration (C) of a compound in soil using the average RF: *

Cx = [(Ax) (Cis) (Wn)(D)] / [(Ais) (RF) (Ws)]

where:	**Example**
Ax = Area of the characteristic ion for the compound being measured	**3122498**
Cis = Concentration of the specific internal standard (ug/L)	**25**
D = Dilution factor for sample as a multiplier (10x = 10)	**1**
Ais = Area of the characteristic ion of the specific internal standard	**611048**
RF = Average RF from the ICAL	**1.004**
Ws = Weight of sample purged (g)	**5**
Wn = Nominal purge weight (g) (5.0 g)	**5**
Cx = Concentration of the compound in the sample being measured (ug/L)	**127.2428**

Dry weight correction:

Percent solids (PCT_S)	**50**
Cd = (Cx) (100)/PCT_S	**254.4856**

* Concentrations appearing on the instrument quantitation reports are on-column results and do not take into account initial volume, final volume, and the dilution factor.

4.0 Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of IS = Ax/Ais

x = amount ratio = concentration analyte/concentration internal standard = Cx / Cis

m = slope from curve = 0.213

b = intercept from curve = - 0.00642

Step 2: Calculate y from Quantitation Report

y = 86550/593147 = 0.1459

Step 3: Solve for x

x = (y - b)/m = [(0.1459 -(- 0.00642)]/ 0.213 = 0.7152

Step 4: Solve for analyte concentration Cx

Cx = Cis (x) = (25.0)(0.7152) = 17.88

Example Spreadsheet Calculation:

Slope from curve, m:	**0.213**
Intercept from curve, b:	**-0.00642**
Area of analyte, Ax:	**86550**
Area of Internal Standard , Ais:	**593147**
Concentration of IS, Cis	**25.00**
Response Ratio:	**0.145917**
Amount Ratio:	**0.715195**
Concentration:	**17.87988**
Units of Internal Standard:	**ug/L**

5.0 Concentration from Quadratic Regression

Step 1 - Retrieve Curve Data from Plot, y = Ax^2 + Bx + C
Where:
Ax^2 + Bx + (C - y) = 0
A, B, C = constants from the ICAL quadratic regression
y = Response ratio = Area of analyte/Area of internal standard (IS)
x = Amount ratio = Concentration of analyte/concentration of IS

Step 2: Calculate y from Quantitation Report

y = Ax/Ais

Step 3: Solve for x using the quadratic formula
Ax^2 + Bx + C - y = 0

$$x = \frac{b \pm \sqrt{\left(b^2 - 4a(c - y)\right)}}{2a}$$ (Two possible solutions)

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(Amount ratio)

Example Spreadsheet Calculation:

Value of A from plot:	**-0.00629**	
Value of B from plot:	**0.511**	
Value of C from plot:	**-0.0276**	
Area of unknown from quantitation report:	**293821**	
Area of IS from quantiation report:	**784848**	
Response ratio, y:	**0.374367**	
C - y:	**-0.40197**	
Root 1 - Computed amount ratio , X1:	**80.44567**	
Root 2 - Computed amount ratio , X2:	**0.794396**	use this solution
Concentration of IS, Cis:	**25.00**	
Concentration of analyte, Cx:	**19.86**	ug/L

2.2 General Chromatography Data

2.2.1 6850 LC/MS Data

2.2.1.1 Summary Data

Microbac Laboratories
Case Narrative

Login Number: L19030638
Department: General Chromatography
Analyst: John W. Richards Jr.

METHOD

Analysis SW-846 6850

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes: Recovery out of range was observed for the following analyte: Perchlorate. Please see the applicable QC report for a detailed presentation of the failures.

Sample #	Analyte	Date	Result	Lower	Upper	Type
L19030638-03	Perchlorate	2019-03-18 20:48:40	80.5	84	119	Recovery

SAMPLES

Samples: All acceptance criteria were met.

Internal Standards: All acceptance criteria were met.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Laboratory Director or the QA/QC Supervisor will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

2.2.1.2 QC Summary Data

Example Calculation 6850 - Perchlorate

Concentration from Linear Regression

Step 1: Retrieve Curve Data From Plot, y = mx + b

y = response ratio = response of analyte / response of internal standard (IS) = Rx/Ristd

x = amount ratio = concentration analyte/concentration internal standard (IS) = Cx / Cistd

m = slope from curve (1.45)

b = intercept from curve (-0.00242)

y = 1.45x + -0.00242

Step 2: Substitute the value for y

where y = 12600/226000 = 0.055752

Step 3: Solve for x

x = (y - b)/m = 0.0040119

Step 4: Solve for analyte concentration Cx

Cx = (Cis)(x) = (5 ug/L)(0.040119) = 0.200594 ug/L

Example Calculation - Water:

Slope from curve, m:	1.45
Intercept from curve, b:	-0.00242
Response of analyte, Rx:	12600
Response of Internal Standard , Ristd:	226000
Concentration of IS, Cistd (ug/L):	5.00
Response Ratio:	0.05575
Amount Ratio:	0.04012
Analyte Concentration, Cx (ug/L) :	0.200594

Example Calculation - Soil:

Analyte Concentration, Cx (ug/L):	0.20059
Amount of soil extracted (g):	5.00
Final volume of extract (mL):	50.00
Percent solids (Pct wt.)	100
Concentration in soil (ug/kg):	2.005938

List of Valid Qualifiers
March 25, 2019

Qualkey: DOD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Greater than
>,H1	Result is greater than the associated numerical value. Sample analysis performed past holding time.
A	See the report narrative
B	The reported result is associated with a contaminated method blank.
B,H1	Analyte present in method blank. Sample analysis performed past holding time.
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
B4,A	The BOD unseeded dilution water blank exceeded 0.2 mg/L. See the report narrative.
B4,F	The BOD unseeded dilution water blank exceeded 0.2 mg/L. Analyte present below the reporting limit (RL).
B4,F,A	The BOD unseeded dilution water blank exceeded 0.2 mg/L. Analyte present below the reporting limit (RL). See the report
B4,ND	The BOD unseeded dilution water blank exceeded 0.2 mg/L. Not detected at or above the reporting limit..
B4,ND,A	The BOD unseeded dilution water blank exceeded 0.2 mg/L. Not detected at or above the reporting limit. See the report na
C	Confirmed by GC/MS
CG	Confluent growth
CT1	Cooler temperature at sample reciept exceeded regulatory limit.
DL	Surrogate or spike compound was diluted out.
E	Estimated concentration due to sample matrix interference
E,CT1	Estimated results. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
F,CT1	Estimated value; the analyte concentration was less than the RL/LOQ. The cooler temperature at receipt exceeded regula
FL	Free Liquid
FP1	Did not ignite.
H1	Sample analysis performed past holding time.
H1,A	Sample analysis performed past holding time.See the report narrative
H1,CT1	Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guidelines for reque
I	Semiquantitative result (out of instrument calibration range)
J	Concentrations >40% difference between the two GC columns
J	Estimated concentration; sample matrix interference.
J	Estimated value ; the analyte concentration was greater than the highest standard
J	Estimated value ; the analyte concentration was less than the LOQ.
J	The reported result is an estimated value.
J,A	Present below nominal reporting limit. See case narrative.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,CT1	Estimated value ; the analyte concentration was less than the LOQ. Cooler temperature at sample reciept exceeded regu
J,H1	Estimated value ; the analyte concentration was less than the LOQ. Sample analysis performed past holding time.
J,H1	The reported result is an estimated value. Sample was analyzed past holding time.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JB	The reported result is an estimated value. The reported result is also associated with a contaminated method blank.
JQ	Found between MDL and RL, but has quality control issue.
JQ	The reported result is an estimated value and one or more quality control criteria failed. See narrative.
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Nontarget analyte; the analyte is a tentativlely identified compound (TIC) by GC/MS
NA	Not applicable
ND	Not detected at or above the reporting limit (RL)
ND, B	Not detected at or above the reporting limit (RL). Analyte present in method blank.
ND, CT1	Analyte was not detected. The concentration is below the reported LOD. The cooler temperature at receipt exceeded reg
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
ND,A	Not detected. See report narrative.
ND,H1	Not detected; Sample analysis performed past holding time.
ND,H1,CT1	Not detected; Sample analysis performed past holding time. The cooler temperature at receipt exceeded regulatory guide
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns

Microbac Laboratories Inc.
List of Valid Qualifiers
March 25, 2019

Qualkey: DOD

Q	One or more quality control criteria failed. See narrative.
Q,H1	One or more quality control criteria failed. Sample analyzed past holding time. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
T5	Laboratory not licensed for this parameter
TIC	Library Search Compound
TNTC	Too numerous to count
TNTC, B	Too numerous to count. Analyte present in method blank.
TNTC,CT1	Too numerous to count. The cooler temperature at receipt exceeded regulatory guidelines for requested testing.
TNTC,H1	Too numerous to count. Sample analysis performed past holding time.
U	Analyte was not detected. The concentration is below the reported LOD.
U,CT1	Analyte was not detected. The concentration is below the reported LOD. Cooler temperature at sample reciept exceeded
U,H1	Not detected; Sample analysis performed past holding time.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UQ	Analyte was not detected. The concentration is below the reported LOD. One or more quality control criteria fail. See nar
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

NELAP Addendum - January 3, 2019

Non-NELAP LIMS Product and Description

The following is a list of those tests that are not included in the Microbac – OVD NELAP Scope of Accreditation:

Heat of Combustion (BTU)
Total Halide by Bomb Combustion (TX)
Particle Sizing - 200 Mesh (PS200)
Specific Gravity/Density (SPGRAV)
Total Residual Chlorine (CL-TRL)
Total Volatile Solids (all forms) (TVS)
Total Coliform Bacteria (all methods)
Fecal Coliform Bacteria (all methods)
Sulfite (SO3)
Propionaldehyde (HPLC-UV)

SOLID AND HAZARDOUS CHEMICALS
Nitrogen, Ammonia by Method 350.1
Chromium, Hexavalent, Leachable by SM3500 Cr-B 2009
Phenolics, Total by Method 420.1
ASTM D3987-06

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD HPLC02/HPLC-UV

Nitroglycerin
Acetic acid
Butyric acid
Lactic acid
Propionic acid
Pyruvic acid

OVD MSS01/GC-MS

1,4-Phenylenediamine
1-Methylnaphthalene
1,4-Dioxane
Atrazine
Benzaldehyde
Biphenyl
Caprolactam
Hexamethylphosphoramide (HMPA)
Pentachlorobenzene
Pentachloroethane

NELAP Accreditation by Laboratory SOP

NONPOTABLE WATER

OVD MSV01/GC-MS

1, 1, 2-Trichloro-1,2,2-trifluoroethane
1,3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide
Dimethylsulfide
Ethyl-t-butylether (ETBE)
Isoprene
Methylacetate
Methylcyclohexane
T-amylmethylether (TAME)
Tetrahydrofuran (THF)

OVD HPLC07/HPLC-MS-MS

Hexamethylphosphoramide (XMPA-LCMS)

OVD HPLC12/HPLC/UV

Acetate
Formate

OVD RSK01/GC-FID

Acetylene
Propane

OVD K9305/ISE

Fluoroborate

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVD MSS0I/GC-MS

1-Methylnaphthalene
Benzaldehyde
Biphenyl
Caprolactam
Pentachloroethane

NELAP Accreditation by Laboratory SOP

SOLID AND HAZARDOUS CHEMICALS

OVD MSV0I/GC-MS

1.3-Butadiene
Cyclohexane
Cyclohexanone
Dimethyl disulfide

DATA VALIDATION REPORT

Volatile Organic Compounds (VOCs) by USEPA SW-846 Method 8260B
Perchlorate by USEPA SW-846 Method 6850

Project:	USACE Longhorn Army Ammunition Plant (LHAAP), Texas Surface Waters – March 2019
Project/Task Number:	10097916 8.0
Sample Data Package:	L19030638
Laboratory:	Microbac Labs, Marietta, Ohio
Sample Matrix:	Surface water
Sampling Dates:	07 March 2019
Validation Guidelines:	Project QAPP *(Final Quality Assurance Project Plan for Longhorn Army Ammunition Plant, Karnack, Texas [July 2014]*); United States Environmental Protection Agency (USEPA) *Test Methods for Evaluating Solid Waste, Physical/Chemical Meth*ods, *3rd edition* (SW-846); *National Functional Guidelines for Inorganic Superfund Data Review (USEPA, September 2016); National Functional Guidelines for Organic Superfund Data Review (USEPA, September 2016)* and professional judgment
Validation Level:	Stage 2BVM (100% of data), Stage 3VM (10% of data)
Data Reviewer:	Jennifer Chandler, HDR

Sample ID	Lab ID	Matrix	VOCs	Perchlorate
SW1	L19030638-01	SW	X	X
SW1 MS	L19030638-02	SW	X	X
SW1 MSD	L19030638-03	SW	X	X
SW2	L19030638-04	SW	X	X
SW3	L19030638-05	SW	X	X
SW4	L19030638-06	SW	X	X
DUP01	L19030638-07	SW	X	X
TB01	L19030638-08	QC Water	X	

SUMMARY

One hundred percent of the data underwent Stage 2BVM level validation. Ten percent of the data underwent Stage 3VM level validation.

Laboratory data were acceptable with qualification as noted below. No data were rejected. Completeness was 100%, which met the goal of 90% for the project.

I. SAMPLE RECEIPT / CHAIN OF CUSTODY

The chains of custody (COC) were filled out and signed. Samples were received within the correct temperature range (at 3.0°C). No qualification was required.

II. SAMPLES ANALYZED

All planned samples were collected and all scheduled analyses were performed. The correct analyte lists were reported. No qualification was required.

VOCs: Samples were analyzed by USEPA SW-846 Method 8260B. Results are reported in µg/L.

Perchlorate: Samples were analyzed by USEPA Method SW-846 6850. Results are reported in µg/L.

III. HOLDING TIMES AND PRESERVATION
All holding time criteria were met and no qualification was required except as noted below.

VOCs: Samples were analyzed within 14 days of collection.

Perchlorate: Samples were analyzed within 28 days of collection. No qualification was required.

IV. BLANKS
METHOD BLANKS
Target analytes were not detected in method blanks except as noted below.

VOCs: VOCs were not detected in the MBs. No qualification was required.

Perchlorate: Perchlorate was not detected in the MBs. No qualification was required.

TRIP BLANKS
VOCs: One trip blank was collected (TB-01). Acetone was detected at 2.67 µg/L, below the limit of quantitation (LOQ) of 10 µg/L. The following samples were detected at less than five times the blank and has been qualified as estimated with a possible high bias (J+): SW-1, SW-2, SW-3, and DUP01.

Perchlorate: Not applicable.

EQUIPMENT RINSE BLANK
Equipment rinse blanks were not required.

INITIAL AND CONTINUING CALIBRATION BLANKS (ICBs and CCBs)
VOCs: Not applicable.

Perchlorate: Perchlorate was not detected in the CCBs. No qualification was required.

V. LABORATORY CONTROL SAMPLES / LABORATORY CONTROL SAMPLE DUPLICATE (LCS/LCSD)
Recoveries and relative percent differences (RPDs) were generally within control limits except as noted below.

VOCs: Recoveries were within control limits. No qualification was required.

Perchlorate: Recoveries were within control limits. No qualification was required.

VI. MATRIX SPIKE / MATRIX SPIKE DUPLICATE (MS/MSD)
VOCs: Sample SW-1 was designated on the COC for MS/MSD analysis. All recoveries and RPDs were within control limits. No qualification was required.

Perchlorate: Sample SW-1 was designated on the COC for MS/MSD analysis. The MSD recovery 80.5% was below the control limits of 84-119%. Sample results were qualified as estimated (J-).

VI. DILUTION TEST AND POST DIGESTION SPIKE (PDS)
A dilution test was performed for analytes detected at least 50 times the concentration of the MRL, and results agreed within ten percent. A post digestion spike (PDS) was performed on

samples and the recoveries were between 80 and 120 percent except as noted below. These tests are applicable only to metals by SW6010C and SW6020.

VOCs: Not applicable.

Perchlorate: Not applicable.

VIII. FIELD DUPLICATES

Field duplicate (FD) samples were collected as shown in the table below. Control limits listed in the QAPP were used.

Field Duplicate Sample	Parent Sample
DUP-01	SW1 (VOCs and perchlorate)

VOCs: Results were within the control limits. No qualification was required.

Perchlorate: Results were within the control limits. No qualification was required.

IX. LABORATORY DUPLICATES

Laboratory duplicate (LD) analyses were not performed on any samples from this project.

X. INSTRUMENT CALIBRATION

INITIAL CALIBRATION

VOCs: The calibration curve included a standard at or below the LOQ. Calibration requirements were met. No qualification was required.

Perchlorate: The calibration curve included a standard at or below the LOQ. Calibration requirements were met. No qualification was required.

INITIAL CALIBRATION VERIFICATION (ICV)

VOCs: ICV results were within the required limits. No qualification was required.

Perchlorate: ICV results were within the required limits. No qualification was required.

CONTINUING CALIBRATION VERIFICATION (CCV)

VOCs: CCV results were within the required limits. No qualification was required.

Perchlorate: CCV results were within the required limits. No qualification was required.

XI. SURROGATES, INTERNAL STANDARDS AND ION RATIOS

VOCs: Internal standard areas and retention times were within required limits. Surrogate recoveries were within control limits. No qualification was required.

Perchlorate: Internal standard areas and ion ratios were within required limits. No qualification was required.

XII. INTERFERENCE CHECK SAMPLES

Interference check sample solutions ICSA and ICSAB were analyzed (methods 6010C and 6020 only).

VOCs: Not applicable.

Perchlorate: Not applicable.

XIII. SAMPLE LIMITS OF QUANTITATION (LOQs)

Limits of quantitation (LOQs) should be less than the applicable cleanup levels as listed in the project QAPP.

VOCs: LOQs were below the groundwater MCLs/cleanup levels.

Perchlorate: LOQs were below the groundwater MCLs/cleanup levels.

XIV. SAMPLE RESULTS / TRANSCRIPTION VERIFICATION

Transcription between the data package and the EDDs was verified. Results reported below the LOQs but above the DLs were qualified as estimated (J). Non-detect results were reported down to the limits of detection (LODs).

VOCs: No issues.

Perchlorate: No issues.

Texas Commission on Environmental Quality,
Superfund Section, MC-136
12100 Park 35 Circle, Bldg D
Austin, TX 78753

Re: August 2019 Underground Injection Control Substantive Requirements Notification for Remedy at LHAAP-04, Longhorn Army Ammunition Plant, Karnack, Texas

Dear Ms. Palmie,

The above-referenced document is being transmitted to you for your records. We are presumptively complying with the substantive requirements of 30 Texas Administrative Code (TAC) §331, Subchapters A, C, and H for Class V Injection Wells. Therefore, unless we hear in the negative within 30 calendar days (August 31, 2019), the injections will be implemented at Site LHAAP-04.

The document was prepared by Bhate Environmental Associates, Inc., on behalf of the Army as part of Bhate's Performance Based Remediation contract for the facility. I ask that Kim Nemmers, Bhate's Project Manager, be copied on any communications related to the project.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

MEMORANDUM FOR RECORD

DATE: August 1, 2019

PROJECT NAME: Remedy for LHAAP-04, Longhorn Army Ammunition Plant, Karnack, Texas

TO:

Rose Zeiler	Site Manager
Rick Smith	Project Manager
Aaron Williams	Project Engineer
Kimberly Nemmers	Bhate Project Manager

FROM: Praveen Srivastav — Bhate Team Deputy Project Manager, Aptim Federal Services, LLC (APTIM), Cell No. 281-639-8743

SUBJECT: **LHAAP-04 Underground Injection Control Substantive Requirements Notification, Longhorn Army Ammunition Plant, Karnack, TX (Contract No. W9128F-13-D-0012, Task Order No. W912BV17F0150)**

INTRODUCTION

Remedial activities are required under the Record of Decision (ROD) issued for the LHAAP-04 Former Pilot Wastewater Treatment Plant (AECOM 2016). The Draft Final (DF) Remedial Design/Remedial Action Work Plan (RD/RAWP) was submitted to Texas Commission on Environmental Quality (TCEQ) for review in April 2019 (U.S. Army 2019). No further comments were received from the regulators, and the RD/RAWP DF became the final document. The RAWP was developed using the basis and details of the RD for LHAAP-04.

As part of the selected remedy, in situ bioremediation (ISB) will be conducted in the area of perchlorate contaminated shallow groundwater with concentrations exceeding five times the TCEQ's Protective Concentration Level (PCL) of 17 µg/L and is planned to be conducted in September 2019. The ISB remedy will be implemented by injection of food-grade emulsified vegetable oil (EVO) to act as an electron donor to enhance populations of indigenous microorganisms that are capable of degrading perchlorate to harmless byproducts (chloride and oxygen).

The enclosed Class V Injection Well Inventory Form (**Enclosure 1**) and TCEQ Core Data Form (**Enclosure 2**) comply with the substantive requirements for construction, operation, and closure under 30 Texas Administrative Code (TAC) §331, Subchapters, A, C, and H (the Applicable or Relevant and Appropriate Requirements [ARARs] for underground injection control).

SITE HISTORY

LHAAP-04, known as Site 04 or the former pilot wastewater treatment plant, is approximately 0.5 acres and is located in the central portion of LHAAP (Class V Injection Well Inventory Form, **Enclosure 1**, Attachment A, Figure 1-2, LHAAP-04 Site Location). The demolition of the former pilot wastewater treatment facility structures, tanks, and piping, and the disposal of the associated wastes were completed in the summer of 1997 as part of the Resource Conservation and Recovery Act (RCRA) closure of the plant. Under the Comprehensive Environmental Response, Compensation, and Liability Act of

1980 (CERCLA) program, excavation of soil impacted with mercury and perchlorate at the LHAAP-04 site was completed in 2009 along the southern edge of the slab, which formerly housed storage tanks for the former pilot wastewater treatment facility.

The U.S. Department of the Army (U.S. Army) issued the Final ROD for LHAAP-04 (AECOM 2016) in October 2016 that was signed by the Army on December 15, 2016, and the U.S. Environmental Protection Agency (USEPA) on March 30, 2017. The Texas Commission on Environmental Quality (TCEQ) issued a letter concurring with the ROD on February 7, 2017. The ROD identified perchlorate as the only constituent of concern (COC) in groundwater for LHAAP-04. The remedy selected in the ROD included in-situ bioremediation (ISB) for perchlorate concentrations in groundwater, long-term monitoring (LTM) of groundwater, and LUCs to maintain the remedy and prohibit groundwater use until COC concentrations are reduced to levels supportive of unlimited use and unrestricted exposure.

PLANNED ACTION

The remedy will include ISB at LHAAP-04 to remediate the area of perchlorate contaminated groundwater with concentrations exceeding five times the PCL. Since the ROD, two shallow groundwater monitoring wells and one intermediate monitoring groundwater well were installed to better define the area of groundwater contamination prior to ISB. The Remedial Design was based on the most recent results and plume as shown on in the Class V Injection Well Inventory Form, **Enclosure 1**, Attachment E. Multiple injections of substrate may be needed based on effectiveness of the ISB.

The implementation of ISB will use a biogrid application for the injection of an electron donor to biodegrade the perchlorate. The Material Safety Data Sheet for the injectate (an emulsified vegetable oil mixture) is included in the Class V Injection Well Inventory Form, **Enclosure 1**, Attachment H.

Implementation of the remedy is planned for September 2019. Per Office of Solid Waste and Emergency Response (OSWER) Directive 9355.7, the Army is presumptively complying with substantive requirement of construction, operation and closure 30 TAC §331, Subchapters, A, C, and H (ARARs for underground injection control).

Section I General Information
Provide the information in items 1 through 8

1. TCEQ Program Area (PST, VCP, IHW, etc.):
2. Agent/Consultant:
3. Facility Name: Longhorn Army Ammunition Plant, LHAAP-04

   Address (Street, City, County, State, and Zip Code) or location description (if no address is available): Northeast corner of Harrison County, located between State Highway 43 in Karnack, Texas, and the western shore of Caddo Lake
4. Latitude and Longitude (degrees-minutes-seconds) and method of determination (GPS, TOPO, etc.) (Attach a Topographic Quadrangle map which identifies the facility location relative to major streets or roadways as Attachment A.)

   Latitude: 32° 40' 58.67" N; Longitude: 94° 9' 5.80" W. LHAAP-04 Site Location Map (Figure 1-2 from the RD/RAWP) is also included in **Attachment A**.
5. Type of Well Construction (Vertical Injection, Subsurface Fluid Distribution System, Infiltration Gallery, Temporary Injection Points, etc.) and Number of Injection Wells:

   25 temporary direct-push injection points will be used to distribute the injectate mixture into the shallow zone.
6. Description regarding purpose of Injection System. Attach a Site Map as Attachment B (Attach the Approved Remediation Plan [if appropriate]):

   LHAAP-04 is a former pilot wastewater treatment plant located in the central portion of LHAAP near the former fire station. Wastewater treatment operations began at LHAAP-04 in 1984. The demolition of the former pilot wastewater treatment facility structures, tanks, and piping, and the disposal of the associated wastes were completed in the summer of 1997. Perchlorate is the only constituent of concern (COC) in groundwater

for LHAAP-04. The remedy selected in the ROD included in-situ bioremediation (ISB) for perchlorate concentrations in groundwater, long-term monitoring (LTM) of groundwater, and LUCs to maintain the remedy and prohibit groundwater use until COC concentrations are reduced to levels supportive of unlimited use and unrestricted exposure.

To implement ISB, emulsified vegetable oil (EVO), diammonium phosphate (microbial nutrient), and water will be injected into the subsurface at 25 locations shown on **Attachment B** (Figure 5-1 from the RD/RAWP) The injectate mixture will consist of approximately 1% (by volume) solution of EVO.

The Remedial Design/Remedial Action Work Plan (RD/RAWP) has been approved by TCEQ and USEPA and the approved injection plan from the RD/RAWP is included as **Attachment B.**

7. Water Well Driller/Installer:

Section II Proposed Down Hole Design

Attach a diagram signed and sealed by a licensed engineer as Attachment C

Name of String	Size	Setting Depth	Sacks Cement/Grout - Slurry Volume - Top of Cement	Hole Size	Weight (lbs/ft) PVC/Steel
Casing	N/A (See Note 1 below)	N/A	N/A	N/A	N/A
Tubing	N/A	N/A	N/A	N/A	N/A
Screen	N/A	N/A	N/A	N/A	N/A

Note 1: The injection of the amendments will be performed via direct-push injection points. The description of the direct-push injection points is provided in Section III below. There will be no permanent casing, tubing, or screens associated with the direct-push injection points.

Section III Proposed Trench System, Subsurface Fluid Distribution System, or Infiltration Gallery

Attach a diagram signed and sealed by a licensed engineer as Attachment D

12. System(s) Dimensions: Approximately 11,025 square feet based on the 85 μg/L perchlorate contour in shallow groundwater.
13. System(s) Construction: The fluid distribution system will consist of a temporary/mobile tanks/containers, hoses, a bulk storage tank, mixing equipment, injection pump, and volume and metering control equipment. Injection points will be advanced using via a tractor mounted rig with a direct-push technology (DPT) hammer. The injectate mixture will be injected using at each proposed direct-push point at 4-foot intervals in the target treatment area. Under this approach, drilling rods (injection probes) are advanced to the proposed injection interval. Injectate mixture will be pumped down through the DPT drilling rods (acting as a temporary well casing) to the injection interval and injectate will be forced through the ports in the rods to the surrounding formation. The tools are then advanced to the next injection depth and the material is again pumped through the rods. This cycle is repeated to provide coverage across the entire vertical treatment interval. Injection flow rates are expected to range from 2 to 6 gallons per minute and an attempt will be made to keep injection pressures below 25 pounds per square inch (psi).

    The injection target intervals are shown in **Attachment C**, and a sample temporary DPT injection point diagram is included as **Attachment D.**

Section IV Site Hydrogeological and Injection Zone Data
Provide the information in items 14 through 31

14. Name of Contaminated Aquifer: Shallow Aquifer
15. Receiving Formation Name of Injection Zone: Unconsolidated Material
16. Well/Trench Total Depth: Injection point depths are vary from 6 to 20 feet (ft) below ground surface (bgs).
17. Surface Elevation: Approximately 205-215 ft
18. Depth to Ground Water: Depth to groundwater measured in monitoring wells ranges from approximately 2 to 10 ft bgs, with the saturated zone generally encountered between 6 and 15 feet bgs
19. Injection Zone Depth: 6 to 20 feet bgs
20. Injection Zone vertically isolated geologically? ☒Y/☐N Impervious Strata between Injection Zone and nearest Underground Source of Drinking Water:

    Name: Intermediate, Upper Deep and Deep Aquifer Zones (clay layers)
    Thickness:
    Intermediate Zone: 35 to 62 ft bgs
    Upper Deep Groundwater: 80 to 151 ft bgs
    Deep Groundwater: Extends below 220 ft bgs
21. Provide a list of contaminants and the levels (parts per million [ppm]) in contaminated aquifer.

    Attach as Attachment E: Perchlorate is the only COC in groundwater. See **Attachment E** showing recent levels of contamination in parts per billion.
22. Horizontal and Vertical extent of contamination and injection plume

    Attach as Attachment F: The horizontal extent of contamination shown in **Attachment E**. The contamination is limited to the shallow zone. There is no impact to the intermediate zone of the aquifer. A separate Attachment F is not provided.
23. Formation (Injection Zone) Water Chemistry (Background levels) TDS, etc.

    Attach as Attachment G: Water chemistry data (dissolved oxygen, oxidation reduction potential, pH, turbidity, etc.) will be collected in the baseline sampling event and will be reported in the Remedial Action Completion Report. A separate Attachment G is not provided.
24. Injection Fluid Chemistry in ppm at point of injection

    Attach as Attachment H: The injection fluid chemistry consists of approximately 1% (by volume) solution of EVO (carbon substrate). The EVO product, EDS-ER™, will be supplied by Tersus Environmental. See **Attachment H** for Safety Data Sheet.

    Water for the solution will be procured from the Leigh Water Company in Karnack, Texas from their potable water supply.
25. Lowest Known Depth of Ground Water with < 10,000 ppm TDS: Unknown

26. Maximum injection Rate/Volume/Pressure: Rate: 2 to 10 gallons per minute; Volume: 1,478 gallons per point; Pressure: 10 to 40 psi (An attempt will be made to keep injection pressures below 25 psi). However, in some cases, depending on the lithology the injection pressure may be higher.
27. Water wells within 1/4 mile radius (attach map as Attachment I): None
28. Injection wells within 1/4 mile radius (attach map as Attachment I): None
29. Monitor wells within 1/4 mile radius (attach driller's logs and map as Attachment I): See **Attachment I**, quarter mile map which indicates approximately 21 monitoring wells within a quarter mile radius from the planned injections.
30. Sampling frequency: Baseline sampling will be conducted prior to the injections followed by quarterly sampling events for eight quarters. The sample results will be included in monitoring reports that will be submitted to TCEQ. Samples will be monitored for perchlorate, field parameters, and biogeochemical parameters to monitor the progress of ISB injections.
31. Known hazardous components in injection fluid: There are no hazardous components in the injection fluid.

Section V Site History
Provide the information in items 32 through 35

32. Type of Facility: Former Longhorn Army Ammunition Plant
33. Contamination Dates: 1940s to 1980s
34. Original Contamination (VOCs, TPH, BTEX, etc.) and Concentrations (Attach as Attachment J): The COC at LHAAP-04 is perchlorate from the wastewater treatment plant formerly located at the site. No separate Attachment J is provided.
35. Previous Remediation: Attach results of any previous remediation as Attachment K. Soil Remedial Action involved excavation of soil contaminated with perchlorate and was documented in the *Final Completion Report Non-Time-Critical Removal Action* dated August 2011. A separate Attachment K is not provided.

<<NOTE>> Authorization Form should be completed in detail and authorization given by TCEQ before construction, operation, and/or conversion can begin. Attach additional pages as necessary.

Safety Data Sheets

- **Electron Donor Solution (EDS-ER™)**

Material Safety Data Sheet

Electron Donor Solution

Section 1: Chemical Product and Company Identification

Product Name: Electron Donor Solution Extended Release
Catalog Codes: EDS-ER
CAS#: 8001-22-7
TSCA: TSCA 8(b) inventory: Soybean oil
HMIS Code: H F R P: 10 0 A
Trade Name and Synonyms: EDS-ER
Chemical Family: Glyceride Oils

Contact Information:
Tersus Environmental, LLC
109 E. 17th Street, Suite #3880
Cheyenne, WY 82001
Ph: 307.638.2822 • info@tersusenv.com
www.tersusenv.com
For emergency assistance, call: 919.638.7892

Section 2: Composition and Information on Ingredients

COMPONANT	CAS #	OSHA TWA	OSHA STEL	ACGIH TWA	ACGIH STEL
Soybean Oil	8001-22-7	---	10 mg/m^3	---	---
Vegetable Oil Derived Fatty Acid Esters	Confidential	---	---	---	---

HAZARDOUS INGREDIENTS: NONE AS DEFINED UNDER THE U.S. OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200) OR THE CANADIAN HAZARDOUS PRODUCTS. ACT S.C. 1987, C.30 (PART 1).

THE PRECISE COMPOSITION OF THIS PRODUCT IS PROPRIETARY INFORMATION. A MORE COMPLETE DISCLOSURE WILL BE PROVIDED TO A PHYSICIAN IN THE EVENT OF A MEDICAL EMERGENCY.

SARA HAZARD: NONE NOTED (SECTION 311/312) TITLE III SECTION 313 - NOT LISTED
All components of this product are listed on the TSCA registry.

Section 3: Physical/Chemical Characteristics

BOILING RANGE: Not applicable VAPOR DENSITY: Exceeds 1.0

SPECIFIC GRAVITY (H20=1.0): 0.92 - 0.925 VAPOR PRESSURE: Not applicable

PERCENT VOLATILE BY VOLUME: 0% SOLUBILITY IN WATER: Miscible

EVAPORATION RATE: Not applicable
APPEARANCE AND ODOR: A pale yellow, oily liquid - only a faint odor.
WEIGHT PER GALLON: 7.7 lbs. at 60F.

Section 4: Fire and Explosion Data

FLAMMABILITY CLASSIFICATION: Combustible Liquid - Class IIIB.
FLASHPOINT: Greater than 550 F (288 C).
METHOD USED: Tag Closed Cup.
EXTINGUISHING MEDIA: CO2, dry chemical, foam, sand.
SPECIAL FIREFIGHTING PROCEDURES: Avoid use of water as it may spread fire by dispersing oil. Use water to keep fire-exposed containers cool. Water spray may be used to flush spills away from fire.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Rags soaked with any oil or solvent can present a fire hazard and should always be stored in UL Listed or Factory Mutual approved, covered containers. Improperly stored rags can create conditions that lead to oxidation. Oxidation, under certain conditions can lead to spontaneous combustion.

Section 5: Reactivity Data

STABILITY: Generally stable. Spontaneous combustion can occur. See Unusual Fire and Explosion Procedures, Section IV.

CONDITIONS TO AVOID: High surface area exposure to oxygen can result in polymerization and release of heat.

INCOMPATABILITY (MATERIALS TO AVOID): Avoid contact with strong oxidizing agents.

HAZARDOUS DECOMPOSITIONS OR BY-PRODUCTS: Decomposition may produce carbon dioxide and carbon monoxide.

HAZARDOUS POLYMERIZATION: Will not occur.

Section 6: Health Hazard Data

THRESHHOLD LIMIT VALUE: As a liquid - none. As oil mist - 10 mg/m3 total particulate.

INHALATION HEALTH RISKS AND SYMPTOMS OF EXPOSURE: Excessive inhalation of oil mist may affect the respiratory system. Oil mist is classified as a nuisance particulate by ACGIH.

SKIN ABSORPTION HEALTH RISKS AND SYMPTOMS OF EXPOSURE: Not classified as a primary skin irritant or corrosive material. Sensitive individuals may experience dermatitis after long exposure of oil on skin.

HEALTH HAZARDS (ACUTE AND CHRONIC): Acute: none observed by inhalation. Chronic: none reported.

EMERGENCY AND FIRST AID PROCEDURES FOR:

SKIN CONTACT: May be removed from skin by washing with soap and warm water.

EYE CONTACT: Immediately flush eyes with plenty of cool water for at least 15 minutes. Do NOT let victim rub eyes.

INHALATION: Immediately remove exposed individual to fresh air source. If victim has stopped breathing give artificial respiration, get medical attention immediately.

Section 7: Precautions for Safe Handling and Use

ENVIRONMENTAL PRECAUTIONS: Where large spills are possible, a comprehensive spill response plan should be developed and implemented.

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Wear appropriate respiratory protection and protective clothing as described in section VIII. Depending on quantity of spill: (a) Small spill - add solid adsorbent, shovel into disposable container and wash the area. Clean area with detergent. (b) Large spill - Squeegee or pump into holding container. Clean area with detergent. In the event of an uncontrolled release of this material, the user should determine if this release is reportable under applicable laws and regulations.

WASTE DISPOSAL METHOD: All recovered material should be packaged, labeled, transported, and disposed or reclaimed in accordance with local, state, and federal regulations and good engineering practices.

Section 8: Control Measures

RESPIRATORY PROTECTION: Not normally needed. A qualified health specialist should evaluate whether there is a need for respiratory protection under specific conditions.

VENTILATION: Handle in the presence of adequate ventilation. Intermittent clean air exchanges recommended, but not required.

PROTECTIVE GLOVES: Not normally needed. However, protective clothing is always recommended when handling chemicals.

EYE PROTECTION: Eye protection is always recommended when handling chemicals. Wear safety glasses meeting the specifications established in ANSI Standard Z87.1.

Section 9: Special Precautions

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE: Store away from flame, fire, and excessive heat.

Section 10: Disposal Considerations

General Information: Do not discharge into drains, watercourses or onto the ground. Discharge, treatment, or disposal may be subject to national, state, or local laws. Empty containers may contain product residues.

Disposal Methods: No specific disposal method required.

Container: Since emptied containers retain product residue, follow label warnings even after container is emptied.

Section 11: Transportation Information

DOT Not regulated.
TDG Not regulated.
IATA Not regulated.
IMDG Not regulated.

Section 12: Other Information

Hazard Ratings

	Health Hazard	Fire Hazard	Instability	Special Hazard
NFPA	1	1	0	NONE

Hazard rating: 0 - Minimal; 1 - Slight; 2 - Moderate; 3 - Serious; 4 - Severe
NFPA Label colored diamond code: Blue - Health; Red - Flammability; Yellow - Instability; White - Special Hazards

	Health Hazard	Flammability	Physical Hazard	Personal Protection
HMIS	1	1	0	--

Hazard rating: 0 - Minimal; 1 - Slight; 2 - Moderate; 3 - Serious; 4 - Severe
HMIS Label colored bar code: Blue - Health; Red - Flammability; Orange - Physical Hazards; White - Special

Section 13: Disclaimer and/or Comments

We suggest that containers be either professionally reconditioned for re-use by certified firms or properly disposed of by certified firms to help reduce the possibility of an accident. Disposal of containers should be in accordance with applicable federal, state and local laws and regulations. "Empty" drums should not be given to individuals.

The conditions of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage or expense arising out of or in any way connected with the handling, storage, use or disposal of the product.

The information above is believed to be accurate and represents the best information currently available to us. However, we make no warranty of merchantability or any other warranty, express or implied, with respect to such information, and we assume no liability resulting from its use. Users should make their own investigations to determine the suitability of the information for their particular purposes. In no event shall Tersus Environmental be liable for any claims, losses, or damages of any third party or for lost profits or any special, indirect, incidental, consequential or exemplary damages, howsoever arising, even if Tersus Environmental has been advised of the possibility of such damages.

BORING/WELL NO. 32WW02 (S)

DATE 7-24-98

CHIEF/UNIT DWC / CME-75

1. PROTECTIVE CASING YES NO

LOCKING YES NO

2. TYPE OF SURFACE SEAL (IF INSTALLED)
cement

3. SOLID PIPE TYPE Stainless steel

SOLID PIPE LENGTH 38.0' ft.

JOINT TYPE SLIP/GLUED/THREADED

4. TYPE OF BACKFILL Bent. /cement Grout

HOW INSTALLED - TREMIE Pipe

FROM SURFACE

5. TYPE OF LOWER SEAL (IF INSTALLED)
Bentonite (hydrated)

6. TYPE OF SECONDARY FILTER PACK
Sand (30-70)

7. SCREEN TYPE stai

SCREEN LENGTH 10.0 ft.

SLOT SIZE #10 machine in.

SCREEN DIAMETER 4 in. (I.D.)

8. TYPE OF PRIMARY FILTER PACK
Primary Sand (16-30)

9. TYPE OF BACKFILL Primary Sand

10. DRILLING METHOD HSA

WATER LEVEL _____ DATE _____

	Top Depth (ft.)	*Bottom Depth (ft.)*	*Description (number of sacks & material)*
Annular Seal Data:	**0**	**15**	**Cement 5 Bags/Sacks**
	15	**20**	**Bentonite 0 Bags/Sacks**

Seal Method: **Tremie**

Sealed By: **Driller**

Distance to Property Line (ft.): **No Data**

Distance to Septic Field or other concentrated contamination (ft.): **No Data**

Distance to Septic Tank (ft.): **No Data**

Method of Verification: **No Data**

Surface Completion: **Surface Slab Installed** **Surface Completion by Driller**

Water Level: **26.98 ft.** below land surface on **2018-02-23** Measurement Method: **Electric Line**

Packers: **No Data**

Type of Pump: **No Data**

Well Tests: **No Test Data Specified**

Water Quality:

Strata Depth (ft.)	Water Type
No Data	No Data

Chemical Analysis Made: **No**

Did the driller knowingly penetrate any strata which contained injurious constituents?: **No**

The driller did certify that while drilling, deepening or otherwise altering the above described well, injurious water or constituents was encountered and the landowner or person having the well drilled was informed that such well must be completed or plugged in such a manner as to avoid injury or pollution.

Certification Data: The driller certified that the driller drilled this well (or the well was drilled under the driller's direct supervision) and that each and all of the statements herein are true and correct. The driller understood that failure to complete the required items will result in the report(s) being returned for completion and resubmittal.

Company Information: **Walker-Hill Environmental, Inc.**

PO 1147
Foxworth, MS 39483

Driller Name: **Gary P Hill** License Number: **58141**

Apprentice Name: **Eric Meitzler**

Comments: **No Data**

IMPORTANT NOTICE FOR PERSONS HAVING WELLS DRILLED CONCERNING CONFIDENTIALITY

TEX. OCC. CODE Title 12, Chapter 1901.251, authorizes the owner (owner or the person for whom the well was drilled) to keep information in Well Reports confidential. The Department shall hold the contents of the well log confidential and not a matter of public record if it receives, by certified mail, a written request to do so from the owner.

Please include the report's Tracking Number on your written request.

TCEQ CORE DATA FORM

00936994

TCEQ Use Only

TCEQ Core Data Form

For detailed instructions regarding completion of this form, please read the Core Data Form Instructions or call 512-239-5175.

SECTION I: General Information

1. Reason for Submission *(If other is checked please describe in space provided.)*

☐ New Permit, Registration or Authorization (*Core Data Form should be submitted with the program application.)*

☐ Renewal *(Core Data Form should be submitted with the renewal form)* ☐ Other

2. Customer Reference Number *(if issued)*	Follow this link to search for CN or RN numbers in Central Registry**	3. Regulated Entity Reference Number *(if issued)*
CN		RN

SECTION II: Customer Information

4. General Customer Information | 5. Effective Date for Customer Information Updates (mm/dd/yyyy)

☐ New Customer ☐ Update to Customer Information ☐ Change in Regulated Entity Ownership
☐ Change in Legal Name (Verifiable with the Texas Secretary of State or Texas Comptroller of Public Accounts)

The Customer Name submitted here may be updated automatically based on what is current and active with the Texas Secretary of State (SOS) or Texas Comptroller of Public Accounts (CPA).

6. Customer Legal Name *(If an individual, print last name first: eg: Doe, John)* | *If new Customer, enter previous Customer below:*

7. TX SOS/CPA Filing Number	8. TX State Tax ID (11 digits)	9. Federal Tax ID (9 digits)	10. DUNS Number *(if applicable)*

11. Type of Customer: ☐ Corporation ☐ Individual Partnership: ☐ General ☐ Limited
Government: ☐ City ☐ County ☐ Federal ☐ State ☐ Other ☐ Sole Proprietorship ☐ Other:

12. Number of Employees
☐ 0-20 ☐ 21-100 ☐ 101-250 ☐ 251-500 ☐ 501 and higher

13. Independently Owned and Operated?
☐ Yes ☐ No

14. Customer Role (Proposed or Actual) – *as it relates to the Regulated Entity listed on this form. Please check one of the following:*

☐ Owner ☐ Operator ☐ Owner & Operator
☐ Occupational Licensee ☐ Responsible Party ☐ Voluntary Cleanup Applicant ☐ Other:

15. Mailing Address:

City		State		ZIP		ZIP + 4	

16. Country Mailing Information *(if outside USA)*	17. E-Mail Address *(if applicable)*

18. Telephone Number	19. Extension or Code	20. Fax Number *(if applicable)*
( ) -		( ) -

SECTION III: Regulated Entity Information

21. General Regulated Entity Information *(If 'New Regulated Entity" is selected below this form should be accompanied by a permit application)*

☐ New Regulated Entity ☐ Update to Regulated Entity Name ☐ Update to Regulated Entity Information

The Regulated Entity Name submitted may be updated in order to meet TCEQ Agency Data Standards (removal of organizational endings such as Inc, LP, or LLC.)

22. Regulated Entity Name *(Enter name of the site where the regulated action is taking place.)*

23. Street Address of the Regulated Entity: *(No PO Boxes)*								
	City		State		ZIP		ZIP + 4	
24. County								

Enter Physical Location Description if no street address is provided.

25. Description to Physical Location:	LHAAP is located in the northeast corner of Harrison County between SH43 and the western shore of Caddo Lake

26. Nearest City	State	Nearest ZIP Code
Karnack	TX	75661

27. Latitude (N) In Decimal:	32.6665	28. Longitude (W) In Decimal:	94.1265

Degrees	Minutes	Seconds	Degrees	Minutes	Seconds
32	39	59.64	94	07	35.4

29. Primary SIC Code (4 digits)	30. Secondary SIC Code (4 digits)	31. Primary NAICS Code (5 or 6 digits)	32. Secondary NAICS Code (5 or 6 digits)

33. What is the Primary Business of this entity? *(Do not repeat the SIC or NAICS description.)*

34. Mailing Address:								
	City		State		ZIP		ZIP + 4	
35. E-Mail Address:								

36. Telephone Number	37. Extension or Code	38. Fax Number *(if applicable)*

Subject: Final Minutes, Monthly Managers' Meeting (MMM), Longhorn Army Ammunition Plant (LHAAP)
Location of Meeting: Karnack Community Center, Karnack, Texas
Date of Meeting: 25 July 2019– 10:30 AM Central Daylight Time (CDT)

Attendees:

Army BRAC:	Rose Zeiler (RMZ)
EPA:	Dorelle Harrison
TCEQ:	April Palmie (AP)
USACE:	Aaron Williams (AW)
AEC:	Amanda Sherman (AS)
USGS:	Kent Becher (KB)
Bhate:	Kim Nemmers (KN)
USFWS:	Paul Bruckwicki (PB)
APTIM:	Praveen Srivastav (PS) and Susan Watson (SW)

Action Items

Bhate/APTIM: PS stated that a proposed subset of wells for the baseline resampling at LHAAP-16 was provided to the Army for review. RMZ stated that the proposed wells could be discussed with the team later in the day. PS stated that the sites are drying out and waste characterization soil samples for LHAAP-17 were collected. KN stated that a field kick-off meeting was planned for later in the day.

KN stated that the water line to well 18WW17 needed to be repaired which had been held up by wet conditions. KN stated that Scott Beesinger was assessing the area and working with the contractor to schedule the repairs. RMZ asked how long the line has been down. KN stated that she would have to confirm the date, but that repairs in June 2019 led to the discovery that the line to well 18WW17 was leaking (the 2-inch line within the 4-inch line).

For the Oil and Gas Water Well Drilling Impact Update, PB stated that no additional information was available. RMZ stated that the action item is with the USFWS Regional office. AS requested more information on the subject. RMZ explained that this action item stems from a comment made during the Five Year Review (FYR). The question was whether there was a land use control for water resources during oil and gas water well drilling that would restrict drilling near a plume. RMZ stated that the main concern is where there is not a clay over the Wilcox Formation, which narrows down the sites to LHAAP-18/24. RMZ stated that the property at LHAAP-18/24 has not been transferred.

Defense Environmental Restoration Program (DERP) Performance Based Remediation (PBR) Update

KN stated the groundwater treatment plant (GWTP) is operating via the generator so LHAAP-16 remains down. AW stated that the transformer will be installed by August 20, 2019 followed by completing connections and testing for a few days. RMZ asked what takes so long. AW clarified that a whole new transformer is being installed and thus entire system needs to be tested. AP asked how long LHAAP-16 will be operated after the transformer is operational. KN stated that she recalled two weeks being the agreed upon time period. AP then confirmed that baseline groundwater samples would be collected after the system was operational for two weeks of time to

which KN concurred. KN explained that poles and lines damaged over the past few months are still requiring repairs, which will be completed ahead of the transformer installation to ensure that the system is operational as soon as possible. PS stated that the water elevations at LHAAP-16, collected in June 2019, show that water level elevations are up which may be a function of lack of pumping and the rainfall. KN stated that most months have received at least 10-inches of rain since September 2018. PS asked if the goal was to have the water table return to previous conditions. RMZ stated that the design was based upon having an operational extraction system and the goal is to have the aquifer behave like the system is operating again. PS stated that the groundwater flow directions based upon the June 2019 data have not changed significantly compared to 2018 groundwater flow, even though the system is not operating. SW clarified that the system has to operate per the remedy so ensuring that the extraction system is operational is important. AP concurred stating that the extraction system is part of the remedy for recirculation also. KN stated that the baseline sampling will allow for evaluation of possible changes from the October 2018 sampling event also. PS stated that approximately 19 of the original 39 monitoring wells (approximately 50-percent) were selected for baseline resampling at LHAAP-16 based upon detections and/or potential influence from extraction. RMZ stated that the wells selected could be discussed further during the kick-off meeting. KB asked how deep the injection was going to be along the bayou wall. PS stated injections along wall would be around 20 feet. KB expressed concern that the intermediate contamination in that area might be missed. RMZ stated that deeper injections were not part of the Remedial Design (RD) being implemented.

PS stated that monitoring wells were being installed, weather allowing, the following week. The intermediate well at LHAAP-16 will be completed because only the outer casing had been installed in October 2018. If conditions are right, the two LHAAP-16 wells on east side of Harrison Bayou will be installed. PS stated that wells are also planned to be installed at LHAAP-12, -50 and -67. PS stated that Scott Beesinger had scouted the location of the wells, and all of the locations at LHAAP-12, -50 and -67 looked to be accessible except a well at LHAAP-50, which is near the creek. PS also discussed the monitoring well with tree roots at LHAAP-46, which likely will need to be replaced if rehabilitation is not effective. RMZ then clarified that installation of wells at LHAAP-16 should be the highest priority, followed by LHAAP-50. SW confirmed that the priority was understood. PS stated that Scott Beesinger will attempt to make an alternate route for installation of the two monitoring wells across the creek at LHAAP-16. PS stated that Scott Beesinger planned to use the dozer to cut the alternative route for the monitoring wells at LHAAP-16 the following week, if the alternative route looks good. PS stated that a surveyor would be onsite to survey the new wells installed in the fall of 2018. RMZ mentioned the replacement well at LHAAP-12 needs to be installed at the same location and depth as the old abandoned monitoring well 12WW10. The new well will be labeled as 12WW10R.

KN asked everyone to refer to the Document and Issues Tracking Table dated July 25, 2019.

- **Task 1** (Project Management) -
    - KN stated that the next MMM is schedule for August 15, 2019 and requested the meeting be moved to August 22, 2019. RMZ concurred with the change to the date. KN stated that the June 2019 MMM Minutes were final.
    - KN stated that the Restoration Advisory Board (RAB) Meeting is being held at the Community Center tonight. The April 2019 meeting minutes were ready for approval at the RAB Meeting. The next RAB meeting is planned for October 17, 2019.

- **Task 3** (LHAAP-03) – PS stated that the Regulators (TCEQ and EPA) have approved the Draft Final RD/Remedial Action Work Plan (RAWP) for LHAAP-03.
- **Task 4** (LHAAP-04) – PS stated that there are no current documents.
- **Task 5** (LHAAP-12) – PS stated that the 2018 Annual Remedial Action Operation [RA (O)] Report was finalized. RMZ then asked if the new well at LHAAP-12 would be installed prior to the next sampling event.
- **Task 6** (LHAAP-16) – KN stated that the 1st Quarter 2019 GWTP Report that was just delivered to the Regulators contains the groundwater sample results from select wells.
- **Task 7** (LHAAP-17) – PS stated that no documents are currently in process for LHAAP-17.
- **Task 9** (LHAAP-37) – PS stated that the validated data from the May 2019 sampling event is provided with the data for this July 2019 MMM. AW stated that the data still shows a blip to the north. KN stated that the Year 2 Quarter 4 RA-O sampling event is planned for early August 2019. KN clarified that the priority, however, is the other work PS discussed, and so it is possible that the sampling events may be pushed until later in the month.
- **Task 10** (LHAAP-46) – PS stated that the Year 5 2nd Semi-Annual RA-O event is planned for August 2019. RMZ asked about the operating properly and successfully (OPS) determination. PS stated that a monitoring natural attenuation (MNA) evaluation will be completed in conjunction with the Year 5 RA-O Report, using all the prior data including the August 2019 data. PS stated that he thought an Army Draft could be provided in October 2019 and then the OPS report could be provided after that. SW clarified that the validated data was due in October 2019 and not the Army Draft report. RMZ stated to AP that the OPS determination was not a statutory requirement but is a transfer requirement for USFWS. RMZ continued that the EPA typically reviews the OPS determination. PS further discussed the monitoring well that has tree roots down into the screen interval, which is surprising since this is approximately 20 feet below the ground surface (bgs). PS explained that the driller has indicated that there is no easy way to remove the tree roots without damaging the well. PS stated that the best option is to install another well within 5 feet of this well. AS asked if the well could be "roto-rooted." SW stated that the concern is damaging the screen. PS stated that the groundwater is not higher than the roots. KN asked if the well could be replaced because that seemed like the best alternative for the issue. AP stated that it seemed reasonable but that she wanted to look at the monitoring well logs.
- **Task 11** (LHAAP-50) – PS stated that Year 5 2nd semi-annual RA-O sampling event was completed in May and the validated data was presented for this July 2019 MMM meeting. PS stated that TCEQ approved the Draft Final Explanation of Significant Difference (ESD) for a contingency remedy. The EPA issued an email on July 15, 2019 indicated no comment on the Draft Final ESD. PS stated that the Army Draft RD/RAWP was under Army review. PS stated that the new monitoring well is being installed next week and the RD/RAWP might be modified based upon the data from the new well. PS stated that the monitoring well will be sampled after it is installed and then any necessary revisions to the RD/RAWP will be completed.
- **Task 12** (LHAAP-58) – KN stated that the LHAAP-58 sampling was completed in June 2019, and that validated data was included with the July 2019 validated data. KN stated that the Year 5 RA(O)Report is being prepared to evaluate the first four quarters of the western plume remedy implementation as well as the continued performance of the eastern plume remedy. KN stated that the Year 5 RA(O) Report was planned for submittal to the Regulators in October 2019. The next groundwater sampling event is the quarterly groundwater monitoring for the western plume in September 2019. KN clarified that the

western plume has another full year of quarterly groundwater monitoring prior to evaluation for OPS.

- **Task 13** (LHAAP-67) – PS stated that the Year 5 2nd semi-annual RA-O validated data was included in the package for this July 2019 MMM.
- **Task 14** (LHAAP-001-R and –003-R) - KN stated that no documents are in process but that the land use control (LUC) inspections were planned for July 2019.
- **Task 16** (GWTP) **–** KN stated that the Regulator comments were received on the 4th Quarter 2018 GWTP report, which are discussed in the 1st Quarter 2019 GWTP Report that was just submitted. KN indicated that the 2nd Quarter 2019 GWTP was being prepared and is anticipated for delivery to the Regulators in October 2019.
- **Task 17** (LHAAP-18/24) – KN stated that two of the monitoring wells from LHAAP-18/24 still need to be sampled and that the hope was that the samples would be collected the following week. KN explained that one monitoring well also had to be sampled in July 2019 due to the wet conditions. AS asked if there was any issues with the wells being sampled over such a long period of time, KN stated that sampling of wells over a month after a majority of the monitoring wells were sampled was not ideal but the only other option was to not sample the wells. KN stated that discussion of the effects of sampling at different times would be discussed in the report. KN also stated that data is compared to historic data and could identify if there was a significant variances. KN stated that the report will likely be prepared with or without this data, at least for the Army Draft. KN stated that the LHAAP-18/24 data will be included the 2nd Quarter 2019 GWTP Report, which is due to the Regulators in October 2019.
- **Task 18** (Surface Water) – KN stated that surface water was collected for analysis in July 2019.
- **Task 19** (LUC Management) - RMZ stated that there will be the three RDs (LHAAP-03, LHAAP-04, and LHAAP-17) that need to be included in the update to the LUC Management Plan. SW asked what the cutoff date was to which RMZ stated September 30, 2019. RMZ stated that the LUC portion of the RD is what goes into the LUC Management Plan. RMZ stated that nothing changed on LHAAP-50 for the LUC for the site. RMZ noted that the recordation for LHAAP-16 will need to eventually be included. RMZ stated that even if LHAAP-16 gets re-surveyed that the new LUC boundary would not go into the 2019 revision to the LUC Management Plan due to timing for completion likely after the cutoff date for the 2019 LUC Management Plan update. RMZ stated that LHAAP-03 did not have a recordation so it is just the RD (LUC portion).
- **Administrative Record (AR) –** SW said that the December 2018 AR hard copies were placed into the site trailer before the meeting. SW said that the list of documents for the AR is being reviewed for the 1st quarter. SW stated that the April through June document list is also being prepared. RMZ stated that the letters for the draft submittal has to be included in the AR for primary documents.

Update on other DERP Sites

- **LHAAP 18/24** – AW explained that the Final Proposed Plan (PP) for LHAAP-18/24 will be placed into the AR. AW stated that he could provide the letter for the draft PP, if needed, for the AR. SW stated that the PP is in the January through March 2019 list and that she would double check if she had the letter transmitting the draft. AW stated that the Record of Decision (ROD) is being prepared for submittal to the Regulators on September 6, 2019.
- **LHAAP-29** – AW stated that the LHAAP-29 PP is ready for AR. Regulator comments on the ROD have been addressed and the Draft Final ROD was issued to the Regulators. RMZ stated that the Army had noticed text was added that should not have been included on one

of the pages with the applicable or relevant and appropriate requirements (ARARs). AW stated that a change page would be issued. AP stated that an email with the change page would be sufficient.

- **LHAAP-47** – AW stated that the Post-Screening Investigation (PSI) Report is ready for the AR. AW stated that the EPA had three comments on the Addendum to the PSI Report, which was submitted on July 1, 2019. AP stated that the EPA comments cover the TCEQ comments. KB stated that Rich Mayer (not present) had mentioned an issue with LHAAP-47. RMZ stated that she felt the issue was the one she called him about and that it might be resolved. RMZ stated that there is one replacement monitoring well with 120,000 parts per billion (ppb) of trichloroethylene (TCE), which may be indicative of dense non-aqueous phase liquid (DNAPL). RMZ stated that only having one point with those levels does not tell us much about how contaminated the aquifer is with TCE. KB suggested understanding the distribution of the contamination along the screen length would be helpful and suggested using passive samplers. PS then explained that the bioremediation process is slow, and high TCE concentrations can be toxic to bacteria. Bioremediation is known to release chlorinated solvents from the soil matrix, allowing contamination to be treated by the bacteria over time, but the process is very slow. RMZ stated that the Army and Regulators don't want to sign a ROD knowing that the remedy will not work, to which AP concurred. AP proposed that the Army write a letter stating that the recently collected data changes the site information and may require that the remedy selected previously also be changed. RMZ asked if there was a quicker way to complete the remedy change other than completing a new PP. PS asked how deep the contamination was located, to which RMZ stated that the contamination was 20 to 30 feet bgs. AW stated that there are borings in the area that were clean that could be used to help bound the contamination. KN asked if the Army could dig the area to which RMZ said excavation would be her preference and that excavation was an element of the selected remedy, but for perchlorate, not TCE. PS cautioned that the contamination will likely rebound with just bioremediation based upon his experience. AS suggested an interim removal action and continue with the current ROD since the issue is limited to one area. Options under CERCLA were discussed for LHAAP-47, but the main issued identified by RMZ is whether the EPA will approve a change to the enforceable schedule. AP pointed out that this is a site held up by the dispute and that the data represents a change condition for LHAAP-47. AS asked if the site would need to be dewatered. RMZ stated that the groundwater was at the clay layer. AP stated that there is no measurable groundwater in many of the wells, which is why the investigation was completed.
- **FYR** – AW stated that the FYR was ready for the AR with the insertion of the errata.
- **Other items -** AP asked about the underground injection control (UIC) submittals. SW explained that the LHAAP-50 submittal is awaiting the additional groundwater sampled to determine if there will be any change in the remedial design. However, the LHAAP-04 UIC was under Army review and will be submitted to TCEQ soon. AP clarified that injection field work can begin only 30 days after UIC submittal. This should be factored into the field work planning.

Schedule Next Managers' Meeting
The next MMM will be held on August 22, 2019 at 10:00 am CDT via a conference call.

Meeting concluded at 11:35 am CDT.

ACRONYM LIST

J - estimated value between the detection limit and limit of quantitation and/or due to quality contol issues

UJ - estimated non-detect due to quality control issues

GWTP Monthly Influent Sampling - June 2019

Location ID: Sample Date:	Units	LH18/24-SP140_060419 6/4/19
Location Description		**GWTP – Collected from a spigot on the influent to TK-140. Sampled Monthly.**
Metals (6020A)		
Selenium	mg/L	< 0.00250 U
Silver	mg/L	< 0.000500 U
Hexavalent Chromium (7196A)		
Hexavalent Chromium	mg/L	< 0.0100 U
Perchlorate (6850)		
Perchlorate	µg/L	**6,800**

mg/L - milligrams per liter

µg/L - micrograms per liter

U- Undetected: The analyte was analyzed for, but not detected and reported to the limit of detection.

LHAAP-58 Remedial Action Operation Validated Data - June 2019

Blue Highlighting Indicates concentrations above the MCL/MSC

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations

NA - Not Analyzed

µg/L - micrograms per liter

mg/L - milligrams per liter

J - Estimated: Between the method detection limit and reporting limit and/or due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered an artifact of blank contamination

Blue Highlighting Indicates concentrations above the MCL/MSC

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations

NA - Not Analyzed

µg/L - micrograms per liter

mg/L - milligrams per liter

J - Estimated: Between the method detection limit and reporting limit and/or due to disc

UJ - The analyte was not detected; however, the result is estimated due to discrepancies

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered an artifact of blank contamination

Subject:	**Final Minutes, Monthly Managers' Meeting (MMM), Longhorn Army Ammunition Plant (LHAAP)**
Location of Meeting:	**Karnack Community Center, Karnack, Texas**
Date of Meeting:	**21 August 2019– 2:00PM Central Daylight Time (CDT)**

Attendees:

Army BRAC:	Rose Zeiler (RMZ)
EPA:	Rich Mayer (RM) and Dorelle Harrison
TCEQ:	April Palmie (AP)
USACE:	Aaron Williams (AW)
AEC:	Amanda Sherman
USGS:	Kent Becher (KB)
Bhate:	Kim Nemmers (KN)
USFWS:	Paul Bruckwicki (PB)
APTIM:	Praveen Srivastav (PS) and Bill Foss (BF)

Action Items

Bhate/APTIM: KN stated that the proposed subset of wells for baseline sampling at LHAAP-16 had been discussed with the Army and that the proposed subset would be provided to the TCEQ and EPA by the end of the week for comment.

KN stated that the water line to extraction well 18WW17 repairs had not been scheduled. KN indicated that the Regulators would be notified once the repairs were scheduled.

Defense Environmental Restoration Program (DERP) Performance Based Remediation (PBR) Update

KN stated the groundwater treatment plant (GWTP) is operating properly. KN stated that the repairs to the conveyance lines at LHAAP-18/24 had resulted in improvements in the difference between the influent and effluent readings for the GWTP based upon the July 2019 evaluation of flow readings. KN also stated that the effluent started to be discharged to the INF pond as of August 20, 2019. KN explained that the effluent is going through the Fluidized Bed Reactor (FBR) and then the ion exchange vessels before discharging to the pond.

AW stated that the transformer was delivered and was to be tested on Wednesday, August 21, 2019. It is expected to be fully operational on Thursday, August 22, 2019. RM asked if the transformer had a warranty on it. AW confirmed that the transformer has a one year warranty. AP asked if there was additional surge protection. AW responded that the transformer should be able to withstand a power surge from lightning strike or storm.

PS stated that monitoring wells were installed at LHAAP-16, -12, -50 and -67. PS stated that the monitoring well at LHAAP-46 needs to be rehabilitated, which is planned for the next Tuesday, August 27, 2019. PS stated that the new wells have been surveyed. PS stated that the groundwater samples have been collected from new wells at LHAAP-16 and LHAAP-50, and data is expected by the end of next week. PS stated that LHAAP-17 is being excavated with mobilization on Monday, August 19, 2019. PS stated that the first loads of soil from LHAAP-17 went off on August 21, 2019. BF stated that 10 total loads were expected to go offsite based upon the turnaround time for each truck of 3.25 hours. PS stated that the plan was to increase to six trucks running the next day (Thursday, August 22, 2019). RMZ asked about the capacity of each truck. BF stated that the trucks are about 18 cubic yards each. KN stated that work was planned for Saturdays also. PS

stated that the landfill is open for part of a day on Saturdays. KN stated that the excavation is starting on the outside of the site. BF stated that the area being excavated is along the western edge of Area H and the excavation is working inwards. AP stated that the daily reports have been helpful.

KN asked everyone to refer to the Document and Issues Tracking Table dated August 21, 2019.

- **Task 1** (Project Management) -KN stated that concurrence/comments were received by the TCEQ on the MMM minutes and the Restoration Advisory Board (RAB) minutes. RM stated the DH and KB would review and that he would provide concurrence/comments.
- **Task 3** (LHAAP-03) – PS stated that there are no current documents. BF stated that the plan is to mark the areas to excavate at LHAAP-03, following removal at LHAAP-17.
- **Task 4** (LHAAP-04) – PS stated that there are no current documents.
- **Task 5** (LHAAP-12) – PS stated that the monitoring well was installed and developed in August 2019, and that the new monitoring well would be sampled in December 2019 during the annual RA-O event.
- **Task 6** (LHAAP-16) – PS stated that injections will begin mid-September and is likely to occur the week of September 23, 2019. PS stated that pre-injection, baseline sampling will be completed prior to the injections and following two weeks of extraction. KN stated that once power is restored, the system at LHAAP-16 will be assessed to determine if or what repairs are needed. Repairs to the extraction system at LHAAP-16 could push the schedule out. KN stated that the requirements for repairs should be known by Friday.
- **Task 7** (LHAAP-17) – PS stated that no documents are currently in progress for LHAAP-17. PS explained that even the area on the northern eastern end of the site is dried up.
- **Task 9** (LHAAP-37) – PS stated that the Year 2, Quarter 4 sampling was completed in August 2019.
- **Task 10** (LHAAP-46) – PS stated that the Year 5 2nd Semi-Annual RA-O event was completed in August 2019. PS stated that the monitoring well rehabilitation/ replacement is planned for Tuesday, 8/27/19. If this well can be sampled, PS explained that the data will be included in the Year 5 2nd Semi-Annual sampling event and in the Year 5 Annual RA-O Report.
- **Task 11** (LHAAP-50) – PS stated that the annual report will be prepared with the last sampling event that occurred in May 2019. PS stated that the new monitoring well had been installed, developed and sampled on 8/15/19. PS explained that the results were due by Friday based upon a 5-day turnaround time. The results will be evaluated to determine if changes to the Contingency RD/RAWP were needed. PS asked RM if there was an update on the EPA's signature of the ESD. RM stated that he would find out the status of the ESD signatures.
- **Task 12** (LHAAP-58) – KN stated that the Year 5 RA(O)Report was in Bhate's internal quality control (QC) review and was planned for delivery to the Regulators in October 2019.
- **Task 13** (LHAAP-67) – PS stated that the Year 5 Annual RA-O Report will be prepared with the last sampling event that occurred in May 2019. PS stated that the two new monitoring wells had been installed and developed in August 2019. PS stated that the monitoring well would be sampled in November 2019 during the Year 6 Annual sampling event.
- **Task 14** (LHAAP-001-R and –003-R) - KN stated that the Annual LTM Report was in Bhate's internal QC review and was planned for delivery to the Regulators in October 2019.
- **Task 16** (GWTP) **–**KN indicated that the 2nd Quarter 2019 GWTP was under Bhate's internal QC and is anticipated for delivery to the Regulators in October 2019.

- **Task 17** (LHAAP-18/24) – KN stated that the validated data available for LHAAP-18/24 had been provided with the validated data provided for the MMM. KN explained that the data from two monitoring wells that could not be sampled due to physically not being able to access the area. KN stated that those wells were sampled in August 2019.
- **Task 18** (Surface Water) – KN stated that surface water had been sampled in July 2019. KN asked if that data had been shared with the TCEQ and EPA. AP and RM stated that they knew of the surface water sample that had exceeded and understood that the resample did not exceed. KN confirmed this to be correct.
- **Task 19** (LUC Management Plan) – KN stated that the LUC Management Plan Update was being completed, but that the DI tracker did not show it being delivered to the Regulators until December 2019. KN stated that the goal was to beat this date.
- **Administrative Record (AR) –** BF stated that additional documents were received for the April 2019 list but that he didn't have an update on the production of January through March 2019 AR. PS stated that he thought the AR for that time period was being compiled still.

Update on other DERP Sites

- **LHAAP 18/24** – AW explained that the Final Proposed Plan (PP) for LHAAP-18/24 will be placed into the AR. AW stated that Record of Decision (ROD) is with Army's Environmental Law Division (ELD) and Assistant Chief of Staff for Installation Management (ACSIM) and that the Army is working to meet the enforceable schedule date of September 6, 2019.
- **LHAAP-29** – AW stated that the LHAAP-29 PP was placed into the AR. AW stated that the ROD was submitted by the Army for EPA signature and TCEQ concurrence in August 2019.
- **LHAAP-47** – AW stated that the Post-Screening Investigation (PSI) Report will be placed into the latest March 2019 AR. AW stated that the Addendum to the PSI Report, will be included in the follow on update to the AR. AW stated that based upon the results at monitoring well WW25R [replacement monitoring well with 120,000 parts per billion of trichloroethylene] that the ROD is being delayed for additional investigation in the area, which will be included in Addendum Number 2 to the PSI Report. AW pointed out that the ROD submittal data was pushed out in the DI tracker to September 30, 2020.
- **Other items –**
  RMZ asked PB if he knew the transfer status of the Environmental Condition of Property 7 parcels and PB said he had not.
  KB stated that two of the samplers had been removed from the Bayou and Goose Prairie Creek. KB stated that the pipe was left in these locations however.

Schedule Next Managers' Meeting

The next MMM will be held on September 18, 2019 at 1:00 CDT via a conference call. In general, calls will be the third Wednesday of each month.

Meeting concluded at 2:38 pm CDT.

ACRONYM LIST

AP	April Palmie
APTIM	APTIM Federal Services, LLC
AR	Administrative Record
AW	Aaron Williams
BF	Bill Foss

Bhate	Bhate Environmental Associates, Inc.
BRAC	Base Realignment and Closure
CDT	Central Daylight Time
DERP	Defense Environmental Restoration Program
DNAPL	Dense Non-Aqueous Phase Liquid

Anions (9056)				
Chloride	mg/L	NV	**292**	**494**
Sulfate	mg/L	NV	**29.9**	**32.3**

µg/L - micrograms per liter

mg/L - milligrams per liter

U- Undetected: The analyte was analyzed for, but not detected and reported to the limit of detection.

NV - No Value

J - estimated value between the detection limit and limit of quantitation and/or due to quality contol issues

GWTP Monthly Effluent Sampling - July 2019

Location ID: / Sample Date:	Units	Daily Maximum Conc	LH18/24-SP650_071619 7/16/19
Location Description			**GWTP – Collected from a spigot on the discharge of effluent TK-650. Sampled monthly**

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residential Protective Concentration Level

LHAAP-18/24 Sampling Event - June 2019

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residentia

LHAAP-18/24 Sampling Event - June 2019

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residentia

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residentia

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residentia

1,4-Dioxane (8270D SIM)							
1,4-Dioxane	µg/l	9.1	NA	NA	NA	NA	NA

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

PCL – Texas Risk Reduction Program (TRRP) Tier 1 Groundwater Residentia

Notes:

Blue highlighting indicates concentrations above the MCL/MSC/PCL

MCL/MSC - Maximum Contaminant Limit/Medium-Specific Concentrations/Protective Concentration Level

NA - Not Analyzed

µg/L - micrograms per liter

a - duplicate sample

mg/L - milligrams per liter

J - Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

UJ - The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

U - Undetected: The analyte was analyzed for, but not detected.

NV - No Value

UB - considered a non-detect due to blank contamination

*Perchlorate, manganese, and nickel compared to the PCL

** Value is for total xylenes

1 INTRODUCTION AND STATEMENT OF PURPOSE

Site and Location: LHAAP-50 is in the north-central section of Longhorn Army Ammunition Plant (LHAAP) and covers approximately 1 acre.

Lead Agency and Supporting Agency:
Lead Agency – U.S. Department of the Army (U.S. Army)
Lead Oversight Agency – U.S. Environmental Protection Agency (USEPA) Region 6
Support Agency – Texas Commission on Environmental Quality (TCEQ)

This Explanation of Significant Differences (ESD) is in compliance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) §117 (c), 42 United States Code (U.S.C.) Section (§) 9617 (c) and National Oil and Hazardous Substances Pollution Contingency Plan (NCP) 40 Code of Federal Regulations (C.F.R.) §300.435(c)(2)(i).

Date of Record of Decision (ROD) Signature: September 2010, Administrative Record, Bate Stamp 00098892-00098976.

Need for ESD: The September 2010 ROD (Shaw, 2010), Section 1.4, specified the implementation of monitored natural attenuation (MNA) for the volatile organic compounds (VOCs) and perchlorate plume to verify that the plumes are stable, and that natural attenuation is occurring. The ROD also specified that performance objectives will be evaluated after two years of monitoring MNA and if MNA is found to be ineffective, a contingency remedy to enhance MNA will be implemented and documented in an ESD.

The 3rd Annual Remedial Action Operation Report for LHAAP-50 (APTIM, 2018) evaluated the performance of MNA for the VOCs and perchlorate plume. The report presented evidence of plume migration, increasing concentrations of perchlorate and trichloroethene (TCE), and geochemical conditions that are not optimal for MNA and recommended that an in situ bioremediation (ISB) contingency remedy be implemented at this time to enhance MNA.

The purpose of this ESD is to document the significant change from the ROD selected remedy of MNA and the proposed implementation of the ISB contingency remedy to enhance MNA. The ISB contingency remedy is consistent with the ROD requirement to enhance MNA, and is capable of degrading perchlorate and TCE to address the increased concentrations detected.

This ESD will become part of the Administrative Record file in accordance with NCP 40 CFR §300.825(a)(2). The file will be located at the Marshall Public Library:

Marshall Public Library

2 SITE HISTORY, CONTAMINATION, AND SELECTED REMEDY

2.1 SITE HISTORY AND CONTAMINATION

LHAAP-50, Former Sump Water Tank, contained a 47,000-gallon capacity aboveground storage tank (AST) which received industrial wastewater from various industrial waste production sumps throughout LHAAP between 1955 and 1988. After the solids were filtered, the storage tank contents were discharged into Goose Prairie Creek upstream of the Goose Prairie Creek bridge on South Crockett Avenue, south of 51st Street. The flow in the creek was sufficient to dilute the water to safe levels (Jacobs, 2002). If natural flow in the creek was considered insufficient, clean water was reportedly pumped into the creek to dilute the contents. The AST is no longer present.

The chemicals of concern (COCs) identified in the LHAAP-50 ROD include dissolved phase perchlorate and VOCs including tetrachloroethene (PCE), TCE, 1,1-dichloroethene (1,1-DCE), 1,2-dichloroethane (1,2-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), and vinyl chloride in groundwater, and perchlorate in soil. There are no COCs in other environmental media at the site. The presence of these COCs at concentrations exceeding the human health cleanup levels in the soil and groundwater represented the primary driver for remedial action, as there were no ecological risks at the site.

Approximately 183 cubic yards of perchlorate-contaminated soil was removed and disposed offsite in September 2013 as described in the Final Remedial Action Completion Report (AECOM, 2016). An area of groundwater contamination is present in the shallow groundwater (upper and lower zones) that poses an unacceptable carcinogenic risk and non-carcinogenic hazard to a future maintenance worker under an industrial exposure scenario. There is no groundwater contamination in the intermediate groundwater zone.

The cleanup levels are the maximum contaminant level (MCL) for the VOCs and the Texas Risk Reduction Program (TRRP) protective concentration level (PCL) for residential use for perchlorate (USEPA, 2014). Concentrations of perchlorate, TCE, 1,1-DCE, and 1,2-DCA have been detected above the cleanup levels. The maximum concentration of perchlorate was detected in the eastern portion of the plume at 91,000 micrograms per liter (µg/L) in May 2018 above the Texas Residential Groundwater PCL. The maximum concentration of TCE as of May 2018 was detected at 620 µg/L in the central part of the plume; 1,1-DCE concentrations were below the MCL as of May 2018; an isolated detection of 1,2-DCA was observed at 83 µg/L as of May 2018.

A Federal Facility Agreement became effective December 30, 1991, among USEPA, the U.S. Army, and the Texas Natural Resources Conservation Commission (TNRCC), now the TCEQ. LHAAP-50 has been added to the list of National Priorities List sites at LHAAP with concurrence from the U.S. Army and USEPA Headquarters.

2.2 SELECTED REMEDY

The selected remedy identified as Alternative 2 in Section 2.12.2 of the ROD for LHAAP-50 includes soil removal, MNA and land use controls (LUCs). This alternative was selected because it was consistent with the intended future use of the site as a wildlife refuge. The alternative also satisfied the remedial action objectives (RAOs) for the site through LUC groundwater restriction, which would ensure protection of human health by preventing human exposure to contaminated groundwater. MNA, and a contingency remedy to enhance MNA, if MNA is found to be ineffective, would return the contaminated water to its potential beneficial use, wherever practicable. Furthermore, long-term monitoring (LTM) would assure that human health and the environment are being protected by verifying that contaminated groundwater does not migrate into nearby surface water bodies at levels that exceed MCLs. This alternative offered a high degree of long-term effectiveness that could be easily implemented at a lower cost than other alternatives.

The following language is taken from Section 2.12.2, Description of the Selected Remedy, of the ROD (Shaw, 2010):

- Excavation of the contaminated soil and disposal in a Resource Conservation and Recovery Act (RCRA)-permitted landfill will remove soil that is considered to be a contaminant source to groundwater, thereby, protecting groundwater. The estimated volume of soil to be removed is 150 cubic yards and is based on the conservative TCEQ soil medium-specific concentration (MSC) for industrial use based on groundwater protection (GWP-Ind) of 7,200 micrograms per kilogram (µg/kg) for perchlorate in soil. The removal of soil contamination will be verified by collecting confirmation samples from the walls and floors of the excavation area and submitting them for laboratory analysis for perchlorate.
- Semi-annual performance monitoring of Goose Prairie Creek adjacent to the LHAAP-50 will be conducted at two locations after excavation of the contaminated perchlorate pathway. Evaluation of this data will be included in the annual reports. The frequency and locations of sampling may be modified after evaluation of data. If perchlorate levels in the creek are consistently above the groundwater MSC for residential use (GW-Res) after two years of monitoring, then additional evaluation will be conducted, and any proposed actions will be included in the annual evaluation report to be submitted after Year 2. The need to continue creek sampling will be evaluated during the five-year reviews.
- *MNA to return groundwater to its potential beneficial use, wherever practicable.* Historic data suggest that natural attenuation of COCs is occurring at the site; however, additional data collection is necessary to fully evaluate natural attenuation. Monitoring wells will be sampled for eight consecutive quarters to evaluate and confirm the occurrence of natural attenuation in conjunction with historical data. Data from the eight quarterly events will be combined with historic data to evaluate the effectiveness of various natural physical, chemical, and biological processes in reducing contaminant concentrations.

- *Performance objectives to evaluate the MNA remedy performance after two years.* Each of the general performance objectives must be met as indicated below. If the criteria are not met to illustrate that MNA is an effective remedy, a contingency action would be initiated. If MNA is effective, a baseline will be established from the data to this point in time. Specific evaluation criteria will be developed in the Remedial Design (RD). The MNA evaluation will be based on the USEPA lines of evidence (USEPA, 1999) and the anaerobic screening (USEPA, 1998) as follows:
  - MNA potential based on evaluating biodegradation screening scores using USEPA guidance.
  - Plume stability (i.e., the plume concentrations are decreasing in the majority of performance wells, and the plume is not expanding in area as demonstrated with compliance wells).
  - MNA Process Evaluation demonstrated based on an attenuation rate calculated with empirical performance monitoring data, and MNA Process Demonstration based on the presence of daughter products and bacterial culture counts.
- *A contingency remedy to enhance MNA to reach the RAO if MNA is found to be ineffective*. The contingency remedy will use elements from other active remedial alternatives included in this ROD to address the ineffective aspects of MNA. The area and the elements of the contingency remedy would be selected based on the entire data set available. If a contingency remedy is implemented, it will be documented in an ESD.
- *Initiate LTM*. If MNA is determined to be effective, monitoring will be conducted to evaluate the remedy performance and determine if the plume conditions remain constant, improve or worsen after the baseline is established. Monitoring will continue after the initial eight quarters at a frequency of semiannual for three years, then annually until the next five-year review. The performance monitoring plan will be developed in the RD and will be based on USEPA guidance (USEPA, 2004).
- *Continue LTM* every five years to evaluate remedy performance and determine if plume conditions remain constant, improve, or worsen. The baseline of the plume for future five-year reviews will be established as part of the MNA evaluation program. The initial LTM plan will be developed during RD.
- LUC to restrict access to the contaminated groundwater to environmental monitoring and testing only until cleanup levels are reached. LUC implementation details will be included in the RD. The recordation notification for the site to be filed with Harrison County will include a description of the LUC. The boundary of the LUC will encompass the site boundaries and the plume boundaries.

This page intentionally left blank.

3 BASIS FOR THE DOCUMENT

The September 2010 ROD (Shaw, 2010), Section 2.12.2, contingency remedy component states that if a contingency remedy is implemented, it will be documented in an ESD. The 3rd Annual Remedial Action Operation Report for LHAAP-50 (APTIM, 2018) presented data that indicated geochemical conditions were not optimal for MNA. The 3rd Annual Remedial Action Operation Report for LHAAP-50 documented that MNA was found to be ineffective through several lines of evidence (APTIM, 2018). The TCE groundwater plume has expanded beyond its baseline footprint and now extends to 50WW12, the current downgradient monitoring well within the plume. At 50WW12, TCE concentrations increased from 0.5 µg/L in October 2013 to 79 µg/L in May 2018 while perchlorate concentrations increased from 23,600 µg/L in October 2013 to 91,000 µg/L in May 2018 suggesting continued migration within the current plume boundary. Though the perchlorate plume was relatively stable, a decreasing trend was observed only at one well (APTIM, 2018). The U.S. Army, USEPA, and TCEQ agree that MNA is currently not effective and that the contingency remedy should be implemented at this time (APTIM, 2018).

This page intentionally left blank.

4 DESCRIPTION OF SIGNIFICANT DIFFERENCES

As stated in Section 2.9.1 of the ROD, the groundwater remedy includes Excavation, MNA and LUC. The ROD states that a contingency remedy to enhance MNA will be implemented to reach the RAOs, if MNA is found to be ineffective, and will be documented in an ESD. The contingency remedy selected in this ESD to enhance MNA is ISB.

Change to Remedy Scope Presented in the ROD:

The only change to the remedy proposed in the ROD is the implementation of the contingency remedy (ISB) to enhance MNA. After three years of MNA performance monitoring, MNA was found to be ineffective (APTIM, 2018). The contingency remedy will consist of injection of emulsified vegetable oil, a microbial culture (SDC-9™), and nutrients to enhance the MNA remedy in an approximately 6,000 square foot area near monitoring wells 50WW12 and 50WW13. Upon implementation of the contingency remedy (ISB), two years of quarterly performance monitoring will be conducted. ISB will be the contingency remedy implemented for the impacted groundwater.

ROD Performance Objectives for the Groundwater Remedy, Section 2.12.2 Description of the Selected Remedy, paragraph 2:

> The MNA evaluation will be based on the USEPA lines of evidence (USEPA, 1999) and the anaerobic screening (USEPA, 1998) as follows:
>
> - MNA potential based on evaluating biodegradation screening scores using USEPA guidance.
> - Plume stability (i.e., the plume concentrations are decreasing in the majority of performance wells, and the plume is not expanding in area as demonstrated with compliance wells).
> - MNA Process Evaluation demonstrated based on an attenuation rate calculated with empirical performance monitoring data and MNA Process Demonstration based on the presence of daughter products and bacterial culture counts.

Change to Performance Objectives:

No change to the performance objectives in the ROD is proposed. MNA is not currently meeting the performance objectives. The 3rd Annual Remedial Action Operation Report for LHAAP-50 (APTIM, 2018) presented evidence of plume migration, increasing COC trends and geochemical conditions that are not optimal for MNA. The contingency remedy (ISB) will enhance MNA and performance objectives will be re-evaluated after two years of quarterly monitoring.

ROD Implementability Determination, Section 2.10.6, Implementability, paragraph 2:

> Alternative 2 (MNA) is easily implemented from a technical standpoint with minimal construction activities followed by long-term sampling, maintenance and enforcement of the LUC.

Change to Implementability:

The contingency remedy (ISB) would be somewhat more difficult to implement due to the specialized expertise required for design and construction. However, ISB is effective in creating conditions conducive to reductive dechlorination and reducing VOC and perchlorate concentrations.

ROD Protection of Human Health and the Environment, Section 2.13.1, Protection of Human Health and the Environment, paragraph 1:

> The selected remedy, Alternative 2, will protect human health and the environment, and achieve the RAOs for LHAAP-50. Although this alternative does not provide for human intervention to remediate groundwater, the alternative is a passive subsurface remedial action conducted by natural processes and mechanisms. The contaminated groundwater will be reduced to protective applicable or relevant and appropriate requirement (ARAR) levels, and the soil above protective ARAR levels will be removed. LUC would prevent human exposure to the contaminated groundwater by prohibiting the construction of potable wells within the LUC boundaries. Surface water monitoring of the creek will verify that the soil removal effectively mitigated the soil-to-groundwater pathway.

Change to Protection of Human Health and the Environment:

Currently, based on the 3rd Annual Remedial Action Operation Report for LHAAP-50 (APTIM, 2018), there is evidence of plume migration, increasing COC trends and geochemical conditions that are not optimal for MNA. The implementation of the contingency remedy (ISB) will enhance MNA and reduce groundwater contaminant concentrations which will prevent contaminated groundwater from migrating into nearby surface water at levels that may present an unacceptable risk to human health and the environment. Monitoring activities associated with the enhanced MNA would assure the protection of human health and the environment by documenting the return of the groundwater to its potential beneficial use as a drinking water supply, and by documenting reduction of the contaminant mass and protection of surface water through containment of the plume.

ROD Cost Estimate for the Selected Remedy, Section 2.12.3, paragraphs 1 and 2:

> Table 2-8 in the ROD (Shaw, 2010) presents the present worth analysis of the cost for the selected remedy, Alternative 2. The information in this table is based on the best available information regarding the anticipated scope of the remedial alternative. The quantities used in the estimate are for estimating purposes only. Changes in the cost estimates are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. Major changes may be documented in the form of a memorandum in the Administrative Record, an ESD, or a ROD amendment. This is an order of magnitude engineering cost estimate that is expected to be within -30 to +50 percent of the actual project cost.

The total project present worth cost of this alternative is approximately $639,000, using a discount rate of 2.8%. The capital cost is estimated at $215,000. The total operations and maintenance (O&M) present value cost is estimated at approximately $424,000. The O&M cost includes evaluation of MNA, maintenance of LUC, and LTM through Year 30. The LTM would support the required CERCLA five-year reviews.

Change to Cost Estimate for the Selected Remedy:

The implementation of the contingency remedy (ISB) for Alternative 2 will increase the overall costs associated with this remedial alternative. This increase in cost is due to the capital cost associated with the use of ISB technology to enhance MNA.

It is estimated that implementation of the contingency remedy (ISB) associated with Alternative 3 will increase the original estimate for this alternative by approximately $280,000.

This page intentionally left blank.

5 SUPPORT AGENCY COMMENTS

The USEPA and TCEQ have reviewed this ESD and support the changes to the selected remedy.

This page intentionally left blank.

6 STATUTORY DETERMINATION

The modification presented herein satisfies CERCLA §121, 42 U.S.C. §9621. The contingency remedy (ISB) will enhance MNA and reduce groundwater contaminant concentrations.

This page intentionally left blank.

7 PUBLIC PARTICIPATION

A notice summarizing the ESD shall be published in the Marshall News Messenger upon finalization of the ESD. This ESD and all supporting ESD documentation will be made a part of the Administrative Record file in accordance with the NCP at 40 C.F.R. §300.825(a)(2). The Administrative Record will be located at the repository identified in Section 1.0 of this document. All public participation requirements set out in NCP at 40 C.F.R. §300.435(c)(2)(i) have been met.

The Proposed Plan for Remedial Action at the site was released for public comments on 25 January 2010. The Proposed Plan identified the preferred alternative to be Alternative 2:

- Excavation and off-site disposal of perchlorate contaminated soil
- MNA of groundwater and LUCs
- A contingency remedy to enhance MNA, if MNA is found to be ineffective

The U.S. Army reviewed all written and oral comments submitted during the public comment period. There were no significant comments captured related to the groundwater remedy.

Re: LHAAP-29 Record of Decision, August 2019
Longhorn Army Ammunition Plant, Karnack, Texas

Dear Ms. Palmie,

Enclosed please find the replacement pages for the August 2019 LHAAP-29 Record of Decision (ROD) for your records. This is the final ROD and includes the completed signature page with Army and EPA signatures, and the TCEQ concurrence.

The Final document transmitted for signature and concurrence on 16 August 2019 was revised in response to EPA's 4 September 2019 request to remove "Major" from the fourth sentence in Section 2.12.3 Cost Estimate of the Selected Remedy. The sentence "Major changes may be documented in the form of a memorandum in the Administrative Record, an Explanation of Significant Difference (ESD), or a ROD amendment" was revised to "Changes will be documented in accordance with 40 CFR 300.435(c)(2) in the form of a memorandum in the Administrative Record, an Explanation of Significant Difference (ESD), or a ROD amendment, as necessary." The revision also required changes to the notes for Tables 2-12 and 2-13. Other than these changes, the document remains the same as the 16 August 2019 Final ROD.

The point of contact for this action is the undersigned. I may be contacted at 479-635-0110, or by email at rose.m.zeiler.civ@mail.mil.

Sincerely,

Rose M. Zeiler, Ph.D.
Longhorn AAP Site Manager

Subject: Record of Decision for LHAAP-29, Former TNT Production Area,
Longhorn Army Ammunition Plant Federal Superfund Site TX6213820529
Karnack, Harrison County, Texas

Dear Mr. Lederle:

The Texas Commission on Environmental Quality (TCEQ) received the final Record of Decision (ROD) for LHAAP-29, Former TNT Production Area, Longhorn Army Ammunition Plant Federal Superfund Site in Karnack, Texas on August 16, 2019. The TCEQ has completed the review of the above referenced document and concurs that the described action is appropriate.

Sincerely,

Toby Baker
Executive Director

1. The Declaration

1.1 Site Name and Location

Longhorn Army Ammunition Plant (LHAAP)-29, Former TNT Production Area, Group 2
Longhorn Army Ammunition Plant
Karnack, Texas

Comprehensive Environmental Response, Compensation, and Liability Information System, U.S. Environmental Protection Agency (USEPA) Identification Number: TX6213820529.

1.2 Statement of Basis and Purpose

This Record of Decision (ROD) presents the selected remedy for LHAAP-29, Former Trinitrotoluene (TNT) Production Area, Group 2 located at the Longhorn Army Ammunition Plant (LHAAP) in Karnack, Texas. The remedy was chosen in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, as amended by the Superfund Amendments and Reauthorization Act (SARA) of 1986, and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), Code of Federal Regulations (C. F. R.) Title 40 §300.

The remedy selection was based on documentation available in the Administrative Record for the site, including the remedial investigation (RI) (Jacobs Engineering Group, Inc. [Jacobs], 2001), baseline human health risk assessment (BHHRA) report (Jacobs, 2002), installation-wide baseline ecological risk assessment (BERA) report (Shaw Environmental, Inc. [Shaw], 2007a), feasibility study (FS) (Shaw, 2010), RI Addendum (AECOM Technical Services [AECOM], 2016), Final Baseline Ecological Risk Assessment Addendum (AGEISS, 2014), FS Addendum (AECOM, 2017) and Revised Proposed Plan (PP) (U.S. Department of the Army [U.S. Army], 2018).

This document is issued by the U.S. Army, the lead agency for this installation. The U.S. Army, USEPA, and the Texas Water Commission (currently known as the TCEQ) entered into the FFA for remedial activities at LHAAP which became effective on December 30, 1991. The USEPA (Region 6) and the Texas Commission on Environmental Quality (TCEQ) are the regulatory agencies providing technical support, project review and comment, and oversight of the LHAAP cleanup program. The USEPA and the U.S Army jointly select the remedy and TCEQ concurs with the selected remedy in this Record of Decision (ROD).

1.3 Assessment of the Site

The response action selected in this ROD is necessary to protect the public health or welfare or the environment from actual or threatened releases of hazardous substances, pollutants, or contaminants into the environment.

1.4 Description of the Selected Remedy

The final selected remedy for LHAAP-29 includes excavation and off-site disposal of contaminated soil, flushing, inspection, and plugging of the trinitrotoluene (TNT) cooling water and wastewater lines, in situ thermal desorption (ISTD) treatment of the intermediate groundwater zone dense non-

aqueous phase liquid (DNAPL) plume, monitored natural attenuation (MNA) for the shallow zone groundwater plumes and for the intermediate groundwater plume following ISTD, and land use controls (LUCs) for soil and groundwater.

The final selected remedy for LHAAP-29 protects human health and the environment by preventing human and ecological receptor exposure to contaminated soil and contaminated groundwater. The human health risk assessment scenarios evaluated were based on the hypothetical future maintenance worker. In the soil, chemicals of concern (COCs) and chemicals of potential ecological concern (COPECs) are explosives (2,4,6-TNT, 2,4-dinitrotoluene [DNT], and 2,6-DNT). Perchlorate is considered a potential soil COC based on groundwater concentrations. In the shallow groundwater zone, the COCs are Volatile Organic Compounds (VOCs) trichloroethene [TCE], 1,2-dichloroethane (DCA), TCE's daughter products cis-1,2-dichloroethene [DCE]), trans 1,2 DCE, and vinyl chloride [VC]), metals (arsenic, mercury, nickel, selenium), explosives (2,4-DNT, 2,6-DNT, 2-nitrotoluene [NT], 3-NT, 4-NT), and perchlorate. In the intermediate groundwater zone, the COCs are VOCs (methylene chloride (MC), TCE, 1,2-DCA, TCE's daughter products 1,1-DCE, cis-1,2-DCE, trans-1,2 DCE, and VC) and arsenic. COCs in the transite TNT wastewater and vitrified clay cooling water lines include explosives (2,4,6-TNT, 2,4-DNT, 2,6-DNT, 2-amino-4,6-DNT, and 4-amino-2,6-DNT, 1,3-dinitrobenzene). Residual MC DNAPL acting as a source material in the intermediate zone may be considered a principal threat waste at LHAAP-29. There are no COCs associated with the deep groundwater zone.

The components of the selected remedy are summarized below:

- Contaminated soil removal with off-site disposal to protect the hypothetical future maintenance worker and ecological receptors and eliminate the soil-to-groundwater pathway. Additional confirmation soil sampling during the remedial design (RD) will be needed to define the final excavation extent and volume of soil contaminated with explosives near former Building 812-F and in the cooling water outfall/ditch and may identify additional areas for soil removal adjacent to the North and South Cooling water lines as well as the wooden and transite TNT wastewater lines, see **Section 2.12.2**.
- Flushing, inspection, and plugging of the transite TNT wastewater line and the vitrified clay cooling water lines to eliminate potential exposure from residual contamination. Confirmation sampling of the wooden TNT wastewater line during the RD may result in excavation, see **Section 2.12.2**.
- MNA in the shallow groundwater zone to confirm protection of human health and the environment by documenting that contaminated groundwater remains localized with minimal migration and that COCs are being reduced to cleanup levels.
    - Performance objectives will be evaluated after two years of MNA. During those two years, monitoring will be quarterly. If MNA is found to be effective, it will be continued, and long-term monitoring (LTM) will be semiannual for three years. In subsequent years, LTM will be annual until the next five-year review and annually thereafter until recommended otherwise by the five-year review. The monitoring and reporting associated with this remedy will be used to track the effectiveness of MNA and will continue until recommended otherwise at the five-year review.
    - If MNA is found to be ineffective, a contingency remedy to enhance MNA would be developed. The contingency remedy would consist of injection of bioremediation

amendments to enhance degradation of the groundwater contaminants at selected locations based on data available at the time it is determined MNA is not successful. Development and specific description of the contingency remedy would be presented in a Remedial Design/Remedial Action Work Plan (RD/RAWP).

- ISTD treatment will be performed for the DNAPL MC plume in the intermediate groundwater zone to reduce concentrations to levels amenable to MNA. One of two ISTD treatment process options, Electrical Resistance Heating (ERH) or Thermal Conduction Heating (TCH), will be selected during the RD.
- MNA will be implemented in the intermediate groundwater zone following successful implementation of ISTD to confirm protection of human health and the environment by documenting that the contaminated groundwater remains localized with minimal migration and that contaminant concentrations are being reduced to cleanup levels. Trigger level or target value for successful ISTD treatment of MC in the intermediate zone is 8,000 micrograms per liter (µg/L). Performance monitoring will be conducted at a frequency necessary to evaluate the effectiveness of the in-situ treatment, with sampling and LTM conducted as described for the shallow groundwater MNA.
- Groundwater monitoring will be conducted to evaluate inorganic COCs. The need to continue groundwater monitoring for this purpose will be evaluated at five year reviews.
- The LUC objectives include maintaining the integrity of any current or future remedial or monitoring systems, and preventing the use of groundwater contaminated above cleanup levels as a potable water source. The groundwater treatment and MNA remedial components include a groundwater monitoring system that will be used to characterize the condition of the groundwater during the period the groundwater remedy is in place until the groundwater remediation goals are achieved, and to demonstrate achievement of the groundwater remediation goals when the groundwater remedy is complete. As a part of this groundwater remedy, the Army will maintain the remedial and monitoring systems associated with the groundwater remedies until these components of the remedy are no longer needed to achieve cleanup levels, and cleanup levels have been achieved. During the period of operation of the groundwater remedy, if any of the elements of the remedial and groundwater monitoring systems are damaged, destroyed, or become ineffective, they will be repaired or replaced with suitable components to assure that the remedial and groundwater monitoring systems are able to provide data of the quality necessary to determine the progress of and eventual completion of this component of the remedy. The actions to be taken to implement these LUC objectives and requirements will be provided through modifying the "Comprehensive Land Use Control (LUC) Management Plan, Former Longhorn Army Ammunition Plant, Karnack, Texas" and detailed in the LUC RD.[1]
- The LUC for prohibition of groundwater use (except for monitoring and testing) shall be implemented and shall remain in place at the Site until the COCs (i.e. including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater remaining at the site, are reduced below levels that would support unlimited use and unrestricted exposure. A LUC RD will be finalized as the land use component of the RD. Within 21 days of the issuance of the ROD, the Army will

[1] This paragraph is October 31, 2014 Dispute Decision language that is included despite the ROD not being subject to the dispute.

propose deadlines for completion of the RD Work Plan, RD and Remedial Action Work Plan. The documents will be prepared and submitted to the EPA and the TCEQ pursuant to the FFA. The LUC RD will contain implementation and maintenance actions, including periodic inspections. The long-term groundwater and surface water monitoring and MNA performance monitoring plan will also be presented in the RD. The recordation notification for the Site, which will be filed with Harrison County, will include a description of the LUCs.[1] The preliminary boundary for the groundwater LUC is shown on **Figure 2-16**.

- The LUC restricting land use to nonresidential shall be implemented until it is demonstrated that surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure.[1]
- The LUC to maintain the integrity of any current or future remedial or monitoring systems will remain in place until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met. The LUC to prohibit groundwater use (except for environmental monitoring and testing) as a potable source will remain in place until the levels of COCs (i.e., all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater allow for unlimited use and unrestricted exposure.[1]

CERCLA five-year reviews are required until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater allow for unlimited use and unrestricted exposure.

Based on a preliminary natural attenuation evaluation and groundwater modeling, cleanup levels are expected to be met through natural attenuation in the shallow zone groundwater in approximately 70 years (Shaw, 2010), and 5-10 years following ISTD treatment in the intermediate zone groundwater (AECOM, 2017). Specifically, based on the attenuation of 1,2-DCA, MNA is estimated to take approximately 70 years in the shallow groundwater zone. The ISTD treatment in the intermediate zone is estimated to take 65-87 days if ERH is used, and 180 days if TCH is used. MNA will follow the in-situ treatment, and is estimated to take 5-10 years based on the attenuation of TCE. Other COCs are expected to require less time to attenuate, based on the natural attenuation study presented in the Final FS (Shaw, 2010). Considering the lithologic variability, particularly the lateral and vertical change from sand to clay, the time to achieve cleanup levels may vary. In the course of the remedy, the additional monitoring results will allow more accurate time estimates.

No adverse impact is expected to the surface water during the time it would take natural attenuation to reduce contaminant concentrations to cleanup levels.

A LUC RD will be finalized as the land use component of the Remedial Design. Within 21 days of the issuance of the ROD, the Army will propose deadlines for completion of the RD Work Plan, RD, and Remedial Action Work Plan. The documents will be prepared and submitted to EPA and TCEQ pursuant to the FFA. The LUC RD will contain implementation and maintenance actions, including periodic inspections. The long-term groundwater and surface water monitoring and MNA performance monitoring plan will also be presented in the RD.[1]

The Army will implement, maintain, monitor, report on and enforce land use controls at Army-owned property. The Army shall perform those actions related to land use control activities described in this ROD and in the Remedial Design for the ROD. For portions of the Site subject to land use controls

that are not owned by the Army, the Army will monitor and report on the implementation, maintenance, and enforcement of land use controls, and coordinate with federal, state, and local governments and owners and occupants of properties subject to land use controls. The Army will provide notice of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. The Army will send these notices to the federal, state and local governments involved at this site and the owners and occupants of the properties subject to those use restrictions and land use controls. The Army shall provide the initial notice within 90 days of ROD signature. The frequency of subsequent notifications will be described in the Remedial Design for the ROD. The Army remains responsible for ensuring that the remedy remains protective of human health and the environment. The Army will fulfill its responsibility and obligations under CERCLA and the NCP as it implements, maintains, and reviews the selected remedy.[1]

Upon transfer of Army-owned property, the Army will provide written notice of the land use controls to the transferee of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. Within 15 days of transfer, the Army shall provide EPA and the TCEQ with written notice of the division of implementation, maintenance, and enforcement responsibilities unless such information has already been provided in the LUC RD. The LUC RD will address the procedures to be used by the Army and the transferee to document compliance with the LUCs described in this ROD. In the event property is transferred out of Federal control, the land use controls relating to property and groundwater restrictions shall be recorded in the deed and shall be enforceable by the United States and the state of Texas.[1]

U.S. Army and regulators will consult to determine appropriate enforcement actions should there be a failure of a LUC objective at the site after they have been transferred.

The management strategy at LHAAP is to approach each site separately to address human health issues and to approach the sites by sub-area to address ecological risk (Shaw, 2007a). Thus, the implementation of this remedy at LHAAP-29 is independent of any other remedial action at LHAAP to address human health issues. To address ecological risk, LHAAP-29 was grouped with several other sites as part of the Industrial Sub-Area. The final COPECs in soil that require remedial action in the Industrial Sub-Area are 2,4-DNT, 2,6-DNT and 2,4,6-TNT (Shaw, 2010). The remedial actions at LHAAP-29 will be sufficient to remove ecological risks for the sub-area. This management strategy is considered to be endorsed by regulators as evidenced by the regulatory approval of the BERA (Shaw, 2007a) and BERA Addendum (AGEISS, 2014).

1.5 Statutory Determinations

The selected remedy is protective of human health and the environment, complies with Federal and State requirements that are established as applicable or relevant and appropriate requirements (ARARS) for the remedial action, and is cost-effective.

The remedy offers long-term effectiveness through excavation of contaminated soil, thermal treatment of MC DNAPL, flushing, plugging, and abandoning the TNT wastewater and cooling water lines, and the implementation of a LUC, which will minimize the potential risk to the hypothetical future maintenance worker posed by the contaminated soil and groundwater. Evaluation of MNA, including routine monitoring of the attenuation until cleanup levels are met, will document the effectiveness of the selected remedy. In the event that MNA is determined to be ineffective, a contingency remedy consisting of injection of bioremediation amendments to enhance degradation of the groundwater contaminants at selected locations will be developed and implemented.

Development and specific description of the contingency remedy will be presented in a RD/RAWP. The selected remedy is easily and immediately implementable and while it was not the lowest cost alternative, is considered most likely to be effective and successful compared to the other alternatives considered for LHAAP-29.

The thermal treatment (ISTD) component of the selected remedy satisfies the statutory preference for treatment as a principal treatment element of the remedy. The MNA component does not address the statutory preference for treatment to the maximum extent practicable; MNA is a passive remedial action using natural processes.

The selected remedy will reduce the toxicity, mobility, or volume of contaminants in the groundwater through active and passive remedial actions. The high concentrations of MC in the intermediate groundwater at LHAAP-29 have indicated that DNAPL residual source material may be residing in the subsurface and acting as a principal threat in the groundwater.

Because hazardous substances, pollutants, or contaminants will remain at the site above levels that allow for unlimited use and unrestricted exposure, a five-year review will be conducted every 5 years to ensure protection of human health and the environment under CERCLA §121(c), U.S. Code (USC) Title 42 §9621(c). In accordance with Texas Administrative Code (TAC) Title 30 §335.566, a notification will be recorded in Harrison County records restricting land use to nonresidential until it is demonstrated that surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; that a prohibition of groundwater use (except for environmental monitoring and testing) as a potable source will remain in place until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater allow for unlimited use and unrestricted exposure; and, that the integrity of any current or future remedial or monitoring systems will remain in place until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met. Although the U.S. Army may later pass these procedural responsibilities to the transferee by property transfer agreement, the U.S. Army shall retain ultimate responsibility for remedy integrity per the FFA and CERCLA §121.

1.6 ROD Data Certification Checklist

The following information is included in the Decision Summary section of this ROD. Additional information can be found in the Administrative Record for this site.

- Current and reasonably anticipated future land use assumptions and current and potential future beneficial uses of groundwater as identified in the baseline risk assessment and ROD (**Section 2.6**).
- Potential groundwater use that will be available at the site as a result of the selected remedy (**Section 2.6**).
- COCs and their concentrations (**Section 2.7**).
- Baseline risk represented by the COCs (**Section 2.7**).
- Cleanup levels established for COCs and the basis for these levels (**Sections 2.7.3** and **2.8**).

- Principal threat wastes that will be addressed at this site (**Section 2.11**).
- Key factor(s) that led to selecting the remedy (**Section 2.12**).
- Estimated capital, annual operation and maintenance (O&M), and total present worth costs, discount rate, and the number of years over which the remedy cost estimates are projected (**Section 2.12**).

1.7 Authorizing Signatures

As the lead agency, the U.S. Army issues this ROD for LHAAP-29 which documents the final selected remedy. The undersigned is the appropriate approval authority for this decision.

Thomas E Lederle — 16 Aug 2019

Region 6

2. Decision Summary

2.1 Site Name, Location, and Description

LHAAP-29, Former TNT Production Area, Group 2
Longhorn Army Ammunition Plant
Karnack, Texas

Comprehensive Environmental Response, Compensation, and Liability Information System
USEPA Identification Number: TX6213820529

Lead Agency: U.S. Army, Department of Defense
Support Agencies: USEPA Region 6, TCEQ

Source of Cleanup Money: U.S. Army, Department of Defense
Site Type: Industrial Facility

The former LHAAP is an inactive, government-owned, formerly contractor operated and maintained, Department of Defense facility located in central east Texas (see **Figure 2-1**) in the northeast corner of Harrison County. LHAAP is approximately 14 miles northeast of Marshall, Texas, and approximately 40 miles west of Shreveport, Louisiana. The former U.S. Army installation occupied 8,416 acres between State Highway 43 at Karnack, Texas, and the southwestern shore of Caddo Lake. The facility can be accessed via State Highways 43 and 134.

LHAAP was placed on the Superfund National Priorities List (NPL) on August 9, 1990. Activities to remediate contamination began in 1990. After its listing on the NPL, the U.S. Army, the USEPA, and the Texas Water Commission (currently known as the TCEQ) entered into a CERCLA §120 FFA for remedial activities at LHAAP. The FFA became effective December 30, 1991. LHAAP operated until 1997 when it was placed on inactive status and classified by the U.S. Army Armament, Munitions, and Chemical Command as excess property. The majority of LHAAP, not including LHAAP-29, has been transferred by the U.S. Army to the U.S. Fish and Wildlife Service (USFWS) for management as the Caddo Lake National Wildlife Refuge.

LHAAP-29, Former TNT Production Area is an 85-acre site located within a heavily wooded section in the western-central portion of LHAAP (**Figure 2-2**). The surface features at LHAAP-29 include the foundations for the former production facilities and the underground pipelines that were originally built for cooling water drainage and TNT wastewater conveyance.

2.2 Site History and Enforcement Activities

2.2.1 History of Site Activities

LHAAP was established in December 1941 with the primary mission of manufacturing TNT. Production of TNT began at Plant 1 in October 1942 and continued through World War II until August 1945, when the facility was placed on standby status until February 1952. In 1952, the LHAAP facility was reactivated with the opening of Plant 2, where pyrotechnic ammunition, such as photoflash bombs, simulators, hand signals, and tracers for 40 millimeter ammunition, were produced until 1956.

In December 1954, a third facility, Plant 3, began production of solid-fuel rocket motors for tactical missiles. Rocket motor production at Plant 3 continued to be the primary operation at LHAAP until 1965 when Plant 2 was reactivated for the production of pyrotechnic and illuminating ammunition. In the years following the Vietnam conflict, LHAAP continued to produce flares and other basic pyrotechnic or illuminating items for the U.S. Department of Defense inventory. From September 1988 to May 1991, LHAAP was also used for the static firing and elimination of Pershing I and II rocket motors in compliance with the Intermediate-Range Nuclear Force Treaty in effect between the United States and the former Union of Soviet Socialist Republics. LHAAP operated until 1997 when it was placed on inactive status and classified by the U.S. Army Armament, Munitions, and Chemical Command as excess property.

LHAAP-29 was used as a TNT manufacturing facility from October 1942 to August 1945. The facility produced approximately 400 million pounds of flake TNT during its operation using six TNT production lines (five active and one standby). The TNT production facility was inactive from August 1945 to 1959. In 1959, most of the buildings and aboveground storage tanks were removed. The debris was burned or flashed at Burning Ground No. 2/Flashing Area (LHAAP-17). Concrete foundations open-top concrete-lined pits, most of the underground utilities, and a network of underground pipelines still remain at the site. Since the end of World War II, the only activity that has been documented to have occurred at LHAAP-29 is the “soak out” or solvent bath of out-of-specification rocket motors. This took place from 1959 to the mid-1970s and involved the use of MC-based industrial solvent at tank 801-F. Waste from this operation was sent to LHAAP-18/24 (Jacobs, 2001).

2.2.2 History of Investigative Activities

As part of the Installation Restoration Program, the U.S. Army began an environmental investigation in 1976 at LHAAP followed by installation wide assessments/investigations that included the following:

- In 1980, U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) conducted a record search to assess the impact of the LHAAP installation activities including usage, storage, treatment, and disposal of toxic and hazardous materials on the environment, and defined conditions that may have adversely affected human health and the environment (USATHAMA, 1980).
- Contamination Survey – In 1982, as part of the LHAAP contamination survey, Environmental Protection Systems collected six groundwater samples for laboratory analyses. Subsequently in 1987, as part of the Resource Conservation and Recovery Act (RCRA) permit application process, and as a continuation of the contamination survey, U.S. Army Environmental Hygiene Agency (USAEHA) identified, described, and evaluated all solid waste management units at LHAAP (USAEHA, 1987). Units requiring further sampling, investigation, and corrective action were delineated.
- RCRA Facility Assessment (RFA) – In 1988, a preliminary RFA was conducted by the U.S. Army (Maley, 988). Waste at the various sites was characterized, but no samples were collected.
- Several investigations to determine the nature and extent of contamination in the soil, groundwater, surface water, and sediments at LHAAP-29 were conducted and are listed below. Samples were analyzed for (VOCs, semivolatile organic compounds (SVOCs),

metals, explosive compounds, perchlorate, pesticides, polychlorinated biphenyls (PCBs), and/or dioxins/furans, depending on the focus of the investigation.

Figure 2-3 and **Figure 2-4** show the sample locations for all investigations. **Figure 2-5** and **Figure 2-6** show well locations and groundwater elevations for the shallow and intermediate groundwater zones, respectively. For some of the earlier investigations, LHAAP sites were organized into groups, and LHAAP-29 was included in Group 2. The group designation was de-emphasized as the complexities of the individual sites increased.

The following summarizes the investigations at LHAAP-29:

- **Multi-phase investigation of Group 2 sites**: Between 1982 and 1998 numerous investigations were conducted in a phased approach by Jacobs, U.S. Army Corps of Engineers (USACE), and Environmental Protection System. Activities included installation of monitoring wells and analysis of groundwater, surface water, soil, and sediment samples. The results are documented in the RI for Group 2 sites (Jacobs, 2001).
- **Plant-wide perchlorate investigation**: The groundwater investigation was conducted from 2000 through 2002 (Solutions to Environmental Problems, Inc. (STEP), 2005) to delineate perchlorate contamination.
- **Baseline Human Health Risk Assessment**: The BHHRA (Jacobs, 2002) used data from the investigations conducted through 2001, including the plant-wide perchlorate investigation results up to that time. The report concluded that the soil at LHAAP-29 posed a non-carcinogenic hazard and the groundwater posed unacceptable carcinogenic risk and non-carcinogenic hazard to the hypothetical future maintenance worker.
- **Environmental Site Assessment**: Media investigated in 2003 included soil and groundwater (Plexus Scientific Corporation, 2005), although no sampling was conducted at LHAAP-29 for this assessment.
- **Baseline Ecological Risk Assessment**: The BERA (Shaw, 2007a) identified COPECs for the Industrial Sub-Area, which includes LHAAP-29. COPECs for the sub-area are addressed in the remedial actions for LHAAP-29. The evaluation was based on environmental investigations from 1993 to 2004.
- **Data Gaps**: Additional investigations were conducted in 2004 after the BHHRA was finalized to further delineate the extent of groundwater contamination identified during previous sampling events. A new monitoring well was installed and a total of 20 wells sampled in August 2004. The results of the 2004 investigation were presented in the *Data Gaps Investigation* (Shaw, 2007b).

Additional investigations were conducted after the 2004 investigation to further delineate contamination as follows:

- Additional investigations were conducted in December 2004 and February 2005 which included sampling soil near the TNT wastewater line, sediments from cooling water lines, the pump house pond, the outfall ditch, and manholes along the cooling water lines. Water was also sampled at the twelve manholes along the cooling water lines. Additional groundwater monitoring well sampling was conducted in May 2005 (Shaw, 2010).
- Sampling of soil at the foundation of former Wash House 806-D was conducted in February 2005 (USACE, 2005). Additional investigations were conducted between August 2006,

February 2007, and February 2008 to further delineate the extent of contamination, and included the activated persulfate oxidation study report (Shaw, 2010).

- Additional groundwater sampling events occurred in October 2008, January 2009, and June 2009 (Shaw, 2010).
- **Feasibility Study**: The FS (Shaw, 2010) was based on all available results from previous investigations through 2009, and the data collected since the risk assessment was evaluated in the FS. Data not formally submitted was incorporated into the FS. The potential soil-to-groundwater pathway was evaluated for the emerging contaminant perchlorate (found in groundwater) and the explosives posing risks or hazards in soil. The concentrations of these chemicals were compared to their TCEQ soil medium-specific concentrations (MSCs) for industrial use based on groundwater protection (GWP-Ind), which is more stringent than the soil MSC for industrial use based on inhalation, ingestion, and dermal contact (SAI-Ind) (TCEQ, 2006). The data collected from the shallow groundwater sampling indicated that MC concentrations were below Safe Drinking Water Act (SDWA) maximum contaminant level (MCLs), and 1,1-DCE concentrations are above the MCL. Additionally, all VOC groundwater data within the plumes were used to evaluate natural attenuation. The FS identified and evaluated 3 remedial alternatives to address the soil and groundwater contamination in the shallow and intermediate zones.
- **Supplemental Investigation**: A Final PP (U.S. Army, 2011) and Draft ROD were prepared in 2011 based on the RI and other investigation results, and the FS. During further evaluation of the RD requirements for the selected alternative, the U.S. Army determined that additional data were needed to refine the extent of the intermediate zone MC plume and also to collect data to evaluate additional treatment technologies, so a supplemental investigation was conducted in 2014. Additional wells were installed in the intermediate zone to define the extent of the MC plume inferred to be DNAPL, measure aquifer parameters, and evaluate thermal treatment of the MC plume, and in-situ bioremediation potential (AECOM, 2016).
- **Baseline Ecological Risk Assessment Addendum:** After the BERA was completed in 2007, a BERA Addendum was completed (AGEISS, 2014). The results of the re-evaluation indicated that that the replacement data collected during the data gaps investigation confirmed the conclusions of the BERA that no explosives compounds in soil should be identified as COPECs in the industrial sub-area.
- **Supplemental FS**: A supplemental FS was prepared in 2017 using the data collected in during the supplemental investigation. A fourth alternative, ISTD, was identified and evaluated to address the MC DNAPL plume in the intermediate groundwater zone (AECOM, 2017). The shallow zone groundwater and soil remediation components of the alternatives did not change from the initial FS.

2.2.3 Site History of CERCLA Enforcement Activities

LHAAP-29 was included in the National Priorities Listing for Longhorn in 1990 and identified as Unit No. 29 in the 1991 FFA. The FS for LHAAP-29 (Shaw, 2010) was issued in April 2010, and the PP (U.S. Army, 2011) was issued in March 2011. A Revised PP was completed in 2018 (U.S. Army, 2018). This ROD follows the Revised PP and precedes the more detailed RD.

2.3 Community Participation

The U.S. Army, USEPA, TCEQ and the LHAAP Restoration Advisory Board (RAB) have provided public outreach to the surrounding community concerning LHAAP-29 and other environmental sites at LHAAP. The outreach program has included fact sheets, media interviews, site visits, invitations to attend quarterly RAB meetings, and public meetings consistent with its public participation responsibilities under Sections 113(k)(2)(B), 117(a), and 121(f)(1)(G) of CERCLA.

The Final Revised PP (U.S. Army, 2018) for the selection of the remedy for LHAAP-29 was released to the Administrative Record and made available to the public for review and comment beginning November 21, 2018. The notice of availability of the Final Revised PP and other related documents in the Administrative Record file was published in *The Shreveport Times* and the *Marshall News Messenger* on November 7, 2018. The newspaper and media notices for the meeting are provided in **Appendix A**. The public comment period for the Revised PP began on November 21, 2018 and ended December 21, 2018. A public meeting was held on December 6, 2018 in a formal format and the meeting recorded by a court reporter. The transcript for the meeting is part of the Administrative Record. The significant comments (oral or written) are addressed in the Responsiveness Summary, which is included in this ROD as **Section 3**.

The previously completed PP (U.S. Army, 2011) was also released to the Administrative Record, and similar public notices and a public meeting were held. Comments received for the 2011 Proposed Plan are also presented in **Section 3**.

The Administrative Record may be found at http://www.longhornaap.com/ and locally at the information repository maintained at the following location:

Location: Marshall Public Library
300 S. Alamo
Marshall, Texas 75670

Business Hours: Monday, Tuesday, Thursday (9:30 AM – 7:30 PM)
Wednesday and Friday (9:00 AM – 5:30 PM)
Saturday (9:30 AM – 3:30 PM)

2.4 Scope and Role of Response Action

The response action will prevent potential unacceptable risks associated with exposure to contaminated soil and groundwater in both the shallow and intermediate zones. The removal of source soils will positively impact groundwater by eliminating the potential for the leaching of contaminants from the soil into the groundwater and will remove the contamination that poses a risk to ecological receptors.

Plugging the inlets and outlets of the underground lines with a bentonite slurry mix, including the manholes of the process cooling water lines, will minimize hypothetical future maintenance workers contact with contaminants and prevent water from infiltrating the lines.

The selected action at LHAAP-29 will prevent potential risks associated with exposure to contaminated groundwater. The groundwater at LHAAP is not currently being used as a drinking water source, nor may it be used in the future based on its reasonably anticipated use as a national wildlife refuge. However, when establishing the remedial action objectives (RAOs) for this response action, the U.S. Army has considered the NCP's expectation to return usable groundwater to its potential beneficial uses wherever practicable and has also considered the State of Texas designation of all groundwater as potential drinking water, unless otherwise classified, and consistent with 30 TAC 335.563(h)(1) [background total dissolved solids (TDS) content less than or equal to 10,000 milligrams per liter (mg/L)] and that occurs within a geologic zone that is sufficiently permeable to transmit water to a pumping well in usable quantities.

The U.S. Army intends to return the contaminated shallow and intermediate groundwater zones at LHAAP-29 to their potential beneficial uses, which for the purposes of this ROD is considered to be attainment of the SDWA MCLs to the extent practicable, and consistent with 40 C.F.R. § 300.430(e)(2)(i)(B & C). In the absence of federal drinking water standards, clean-up levels will be based on the Texas Risk Reduction Program (TRRP) Tier 1 Residential Groundwater Protective Concentration Level (PCL) (TRRP Residential Groundwater PCL). The TCEQ soil medium specific concentration (MSC) for industrial use based on groundwater protection (GWP-Ind) is used in accordance with 30 TAC 335.559(g)(2). If a return to potential beneficial uses is not practicable, the NCP expectation is to prevent further migration of the plume, prevent exposure to the contaminated groundwater, and evaluate further risk reduction (40 C.F.R. § 300.430(a)(1)(iii)(F)).

The selected remedial action will also ensure containment of the plume to prevent potential impact to surface water. The selected action will also include groundwater monitoring to demonstrate that the plume is not migrating at levels that present a potential impact to surface water bodies and to verify that contaminant levels are being reduced to cleanup levels when the LUC for groundwater use prohibition may be terminated.

In addition, the selected action includes an active remedial component that will mitigate the principal threat waste. By instituting an ISTD treatment of the intermediate groundwater, this active treatment will be applied to the highest concentration area in the MC groundwater plume and will comply with NCP expectations regarding treatment of affected media where principal threat waste may be considered.

2.5 Site Characteristics

This section of the ROD presents a brief comprehensive overview of the LHAAP-29 site characteristics with respect to the conceptual site model (CSM), physical site features, known or suspected sources of contamination, types of contamination, and affected media. Known or potential routes of contaminant migration are also discussed. Detailed information about the site characteristics can be found in the RI (Jacobs, 2001).

2.5.1 Conceptual Site Model

Figure 2-7 illustrates the human health conceptual site model for LHAAP-29. The model presents the human health pathways that are complete and being considered for remediation. Those

pathways that are likely to be incomplete or have negligible impact are not being considered for remediation. The ecological conceptual model for LHAAP-29 (**Figure 2-8**) is similar to the one presented for human health in terms of the origin and fate and transport mechanisms of the contaminants present at the site. However, only exposure pathways and routes associated with soil are relevant for ecological risk assessment.

Explosive compound releases resulting from the manufacturing process of TNT as well as releases from process tanks and process waste pipelines are the suspected contamination sources at LHAAP-29. Releases from the rocket motor soak-out process that used methylene chloride-based solvents are also contamination sources. The pipelines include the TNT process wastewater gravity line (“red and/or yellow liquor”) that transported the TNT process wastewater to LHAAP-32 for treatment and two cooling water lines (blue water) that transported the cooling water to an outfall ditch. The remaining potential sources of contamination at the site are explosives compounds in stained soils around the foundation of former Buildings 806A and 806-D, isolated perchlorate-containing soils in the northeastern portion of LHAAP-29 at a depth of 8 feet below ground surface (bgs), and TNT-contaminated sediment in the cooling water outfall ditch at a depth of 7 feet bgs.

The red liquor TNT wastewater line was originally installed as a wooden pipeline at a depth of three to five feet bgs and was taken out of service, clear-flushed and abandoned in 1946 (Bate Stamp 001446, RFA, April, 1988). Several trenches were excavated across the wooden line in 1993, and the wood was found to be soft and severely degraded at most locations (Sverdrup Environmental, Inc. [Sverdrup], 1993). Samples collected at that time resulted in high concentrations of TNT in the liquid and sludge (3,500 µg/L and 3,700 mg/kg, respectively), but that data was later deemed unusable for environmental decision making (Jacobs, 2001). The transite TNT wastewater pipeline was added parallel to and north of the wooden line to carry the TNT wastewater. The transite TNT wastewater line has solid residues contaminated with explosives at concentrations above the GWP-Ind.

Two blue cooling water lines, called cooling water line north and cooling water line south, exist at LHAAP-29 and range from 8 to 18 inches in diameter. These are gravity fed lines and are constructed of vitrified clay pipe with manholes. These lines have solid residues contaminated with explosives at concentrations that are above the GWP-Ind MSC (solid residue).

Contamination in the form of explosive compounds, VOCs, perchlorate, and metals from rocket motor washout and TNT production is present in the shallow groundwater zone at LHAAP-29 and poses potential risk to the hypothetical future maintenance worker. In the intermediate groundwater zone, concentrations of VOCs and arsenic are present, with MC posing the highest risk. At monitoring well 29WW16 the MC concentrations in the intermediate zone are approximately half the solubility limit, which indicates a potential for the presence of DNAPL. The horizontal extent of contamination in the shallow and intermediate groundwater zones is presented in **Figures Figure 2-9,** and **Figure 2-11**.

The soil and groundwater at LHAAP-29 may pose an unacceptable risk for the hypothetical future maintenance workers. Even though no impact to surface water from groundwater has been established (Shaw, 2007c); the migration pathway of groundwater contaminants to surface water is being considered for remediation along with soil, soil to groundwater, and future industrial groundwater use.

2.5.2 Overview of the Site

The site boundary of LHAAP-29 comprises approximately 85 acres in the western-central portion of LHAAP. The surface features include the foundations for the former production facilities and the underground pipelines that were originally built for cooling water drainage and TNT wastewater conveyance. The site is currently heavily wooded. Surface runoff is collected by ditches constructed in 1942 when the production facility was built. Surface runoff from the northern part of the site (about 40 percent of the site) enters Goose Prairie Creek located approximately 1,500 feet to the north and east of the site. Surface water runoff in the southern portion of the site (about 60 percent of the site) flows into a tributary of Central Creek located near the southeast portion of the site. Eventually, runoff from the two creeks enters Caddo Lake.

2.5.3 Geology and Hydrogeology

The local geology at LHAAP-29 consists of a silty to clayey sand at the surface that extends from 3 to 10 feet bgs. A clayey silt grading to a silty clay was encountered extending to a depth of 40 feet bgs with an underlying silty to clayey sand. With the exception of boreholes 29WW02, 29WW10, and 29WW11, a sandy silt to silty clay layer was encountered below the sand deposit at depths ranging 15 to 26 feet bgs. Additional silt, clay and sand layers were encountered with depth in boreholes 29SB52 and 29SB53 that terminated at the top of the Midway formation at depths of 157 and 140 feet bgs, respectively.

There are three groundwater zones at LHAAP-29: shallow, intermediate, and deep. Semi-confining clay or silty clay layers separate the three groundwater zones. The shallow groundwater zone has wells that are screened at two depths (shallow and lower shallow); however, the wells have similar water level elevations and are all considered to be shallow zone wells. The bottom of each of the zones is defined by a continuous or semi-continuous clay layer of varying thickness. The depth of the shallow groundwater zone generally ranges from 17 to 45 feet bgs because of variable ground surface elevations across the site. The intermediate zone is less defined, but its depth has been measured to approximately 88 feet bgs. The deep groundwater zone extends to a depth of approximately 155 feet bgs. Based on the 2007 water levels and historic potentiometric maps, the predominant groundwater flow in the shallow zone is east/southeast and is east/northeast in the intermediate zone. **Figures 2-5** and **2-6** illustrate the groundwater elevations in the shallow zone and intermediate zone, respectively.

2.5.4 Sampling Strategy

Nineteen investigations/sampling events were conducted at LHAAP-29 from 1982 to 2014, as described in **Section 2.2.2**. In the early investigations, soil samples were collected from throughout the site to determine the areas of contamination. Subsequent investigations focused on the areas where contamination was found, performing additional soil, groundwater, and sediment sampling, and installing monitoring wells to delineate the groundwater contamination. Samples from all media were analyzed for various analytes including VOCs, SVOCs, metals, explosives, perchlorate, pesticides, and dioxins/furans. In the intermediate groundwater contaminant plume, groundwater samples were also analyzed for indicators of conditions that promote natural attenuation (biodegradation), such as dissolved oxygen, conductance, pH, oxidation-reduction potential, sulfide, methane, and chloride. During the 2014 investigation, soil resistivity and total organic carbon data were measured to provide additional data to evaluate ISTD technologies, and microcosm testing was performed to evaluate the potential for in enhanced in-situ bioremediation (EISB). Aquifer

pumping tests were also conducted to gather site-specific hydraulic conductivity data to support the evaluation of additional treatment technologies.

2.5.5 Nature and Extent of Contamination

Contamination was found in the soil, groundwater (shallow and intermediate zones), and liquid and solid residue remaining in the cooling water and TNT process wastewater underground lines. The COCs are toxic and carcinogenic. Since there is a high cancer risk associated with exposure to groundwater from this region of the intermediate zone, such residual source material may be considered a principal threat waste at LHAAP-29.

Groundwater

Shallow zone groundwater COCs are VOCs (TCE, 1,2-DCA, and daughter products), perchlorate, explosives (2,4-DNT, 2,6-DNT, 2-NT, 3-NT, 4-NT), and metals (arsenic, mercury, nickel, selenium).

The shallow zone plumes for VOCs and perchlorate are shown on **Figure 2-9**. The most recent maximum concentrations of COCs in shallow groundwater were all detected in samples collected from monitoring well 29WW15, and included TCE at 344 µg/L, 1,2-DCA at 5,520 µg/L and perchlorate at 16,800 µg/L. The calculated volume of the perchlorate plume is 4 million gallons. There are 3 shallow zone plumes for explosives as shown on

Figure 2-10. The highest concentration of 2,4-DNT detected was 50.9 µg/L at monitoring well 29WW05. The highest concentration of 2,6-DNT was 239 µg/L at monitoring well 116. The highest concentrations of 2-NT, 3-NT, and 4-NT are 8,140 µg/L, 451 µg/L, and 1,400 µg/L, respectively, also reported at monitoring well 116. The volume of the VOC, perchlorate, and NT plumes are estimated to be approximately 9 million gallons, assuming a total porosity of 0.25 (or 25 percent) with a thickness ranging from 5 to 10 feet.

Intermediate zone groundwater COCs are MC, TCE and daughter products, 1,2-DCA, and arsenic. The intermediate zone plume for VOCs is shown on **Figure 2-11**. The highest concentration of MC detected was 10,300,000 µg/L at monitoring well 29WW16. The most recently reported MC concentration in a 2014 sample collected from this well was 8,260,000 µg/L. Other COCs identified for the intermediate groundwater zone are degradation (daughter) products of TCE that have been non-detect or have not been detected above their SDWA MCLs; however, due to historic results and the high detection limits at 29WW16, it has been assumed that concentrations of 1,2-DCA and TCE still exceed their SDWA MCLs. The calculated volume of contaminated groundwater that exceeds MCLs is 650,000 gallons, assuming a total porosity of 0.40 (or 40 percent) with an average thickness of 15 feet based on drilling observations.

As demonstrated by previous sampling results, the deep groundwater zone at LHAAP-29 is not affected.

Soil

Soil COCs and COPECs are explosives (2,4,6-TNT, 2,4-DNT, 2,6-DNT) and perchlorate. **Figure 2-12** shows the approximate areas of contaminated soil. The maximum 2,4,6-TNT concentration in the soil is 26,000 milligrams per kilogram (mg/kg). Other explosives, 2,4-DNT and 2,6-DNT, have maximum concentrations of 8,000 mg/kg and an estimated concentration of 15 mg/kg, respectively. Additionally, perchlorate has been detected in the soil at a maximum concentration of 8.6 mg/kg. The estimated volume of impacted soil is 3,900 cubic yards in place.

TNT Wastewater Lines

Line solid residue COCs from the transite TNT wastewater line are explosives (2,4,6-TNT, 2,4-DNT, 1,3 dinitrobenzene, 2-amino-4,6-DNT, 4-amino-2,6-DNT). Contaminated explosive solid residue remains within the transite TNT wastewater line at concentrations above the SAI-Ind and GWP-Ind MSCs, but access to the pipe is limited to the inlets and outlets unless the pipe is penetrated. Additionally, the line is buried 3 feet bgs or deeper. The gravity flow portion of the line is approximately 3,000 linear feet. The pressurized portion of the line is approximately 1,000 linear feet. The line is in good condition. **Figure 2-13** shows the TNT wastewater lines at LHAAP-29, soil, sediment, and solid residue sampling results and MSC values.

The wooden TNT wastewater line was previously flushed and abandoned. The results from limited soil samples collected near the line indicate there has not been a release to the surrounding soil above the cleanup levels. The line is buried 3 feet bgs or deeper, but the deteriorated condition of the line and the potential for residual explosives may present a continuing source of groundwater contamination.

Cooling Water Lines

Line solid residue COCs from the vitrified clay cooling water lines are explosives (2,4,6-TNT, 2,4-DNT, 2,6-DNT, 2-amino-4,6-DNT, 4-amino-2,6-DNT). The solid residues from the manholes are

contaminated with explosives at concentrations that are above the GWP-Ind (solid residue). The north and south vitrified clay cooling water lines are accessible through manholes, and the liquid and solid residue contents from the manholes were sampled. There are approximately 5,000 feet of pipe in the main lines, approximately 1,680 linear feet of pipe from each production area to the main line, and 12 manholes. **Figure 2-13** shows the cooling water lines and sampling results of the line contents at LHAAP-29.

2.6 Current and Future Land and Resource Uses

2.6.1 Current and Future Land Uses

LHAAP is located near the unincorporated community of Karnack, Texas. Karnack is a rural community with a population of 775 people. The incorporated community of Uncertain, Texas, population 205, is located to the northeast of LHAAP on the edge of Caddo Lake and is a resort area and an access point to Caddo Lake. The industries in the surrounding area consist of agriculture, timber, oil and natural gas production, and recreation.

LHAAP has been an industrial facility since 1942. Production activities and associated waste management activities continued until the facility was determined to be in excess of the U.S. Army's needs in 1997. The plant area has been relatively dormant since that time. LHAAP is surrounded by a fence (except on the border with Caddo Lake), and current security measures at the LHAAP preclude unlimited public access to areas within the fence. The fence now represents the National Wildlife Refuge boundary. Approved access for hunters is limited.

The reasonably anticipated future use of LHAAP-29 is as part of a national wildlife refuge. This anticipated future use is based on a Memorandum of Agreement (MOA) (U.S. Army, 2004) between the USFWS and the U.S. Army. That MOA documents the transfer process of the LHAAP acreage to USFWS to become the Caddo Lake National Wildlife Refuge and will be used to facilitate a future transfer of LHAAP-29. Presently the Caddo Lake National Wildlife Refuge occupies a little more than 7,100 acres of the 8,416-acre former installation. In accordance with the National Wildlife Refuge System Administration Act of 1966 and its amendments (16 USC 668dd), the land will remain as a national wildlife refuge unless there is a change brought about by an act of Congress, or the land is part of an exchange authorized by the Secretary of the Interior.

2.6.2 Current and Future Surface Water Uses

Streams on LHAAP currently support wildlife and aquatic life. While humans may have limited access to some streams during annual hunts, there is no routine human use of streams on LHAAP. The streams do not carry adequate numbers and size of fish to support either sport or subsistence fishing. During the summer months, the streams cease flowing and/or dry up. The streams flow into Caddo Lake. Caddo Lake is a large recreational area that covers 51 square miles and has a mean depth of 6 feet. The watershed of the lake encompasses approximately 2,700 square miles. It is used extensively for fishing and boating. Caddo Lake is a drinking water supply for multiple cities in Louisiana including Vivian, Oil City, Mooringsport, South Shore, Blanchard, Shreveport, and Bossier City.

The anticipated future uses of the streams and lake are the same as the current uses.

2.6.3 Current and Future Groundwater Uses

Groundwater in the aquifer (250 to 430 feet bgs) near LHAAP is currently used as a drinking water source. The drinking water aquifer should not be confused with the deep zone groundwater, which extends only to a depth of approximately 151 feet bgs. The deep zone groundwater and the drinking water aquifer are distinct from each other and there is no connectivity between the contaminated zone and the drinking water aquifer. There are five active water supply wells near LHAAP that are completed in the drinking water aquifer (**Figure 2-2**). One well is located in and owned by Caddo Lake State Park. The well is completed to a depth of 315 feet bgs and has been in use since 1935. A second well owned by the Karnack Water Supply Corporation services the town of Karnack and is located approximately 0.3 miles northwest of town. This well is completed to approximately 430 feet bgs and has been in use since 1942. The Caddo Lake Water Supply Corporation has three wells located both north and northwest of LHAAP. These wells are identified as Caddo Lake Water Supply Corporation Wells 1, 2, and 3, and all are hydraulically upgradient of LHAAP (Jacobs, 2002). These wells are completed deeper than the deepest zone of contamination at LHAAP. Because of this and the large distance between these wells and LHAAP, water removal from these wells is not expected to affect groundwater flow at the site. In addition, there are several livestock and domestic wells located in the vicinity of LHAAP with depths averaging approximately 250 feet bgs.

Three water supply wells are located within the boundary of LHAAP itself. One well is located at the Fire Station; the second well is located approximately 0.35 miles southwest of the Fire Station. The third well is located north of the USFWS administration building for the Caddo Lake National Wildlife Refuge, near the main entrance to LHAAP. The distances from these water supply wells to LHAAP-29 are approximately 0.4 miles, 0.2 miles, and 0.5 miles, respectively (**Figure 2-2**). The three water supply wells were completed at a depth much greater than the zone of contamination described at LHAAP-29. None of these three wells are currently used for drinking water at LHAAP, although they may supply water for non-potable uses. Two additional wells previously supplied water to the installation, but these have been plugged and abandoned.

Although the anticipated future use of the facility as a wildlife refuge does not include the use of the groundwater at LHAAP-29 as a drinking water source, the State of Texas designates all groundwater as potential drinking water, unless otherwise classified, and consistent with 30 TAC 335.563(h)(1). To be conservative, a hypothetical industrial use scenario was evaluated for risk. The future industrial scenario for LHAAP assumes limited use of groundwater as a drinking water source.

2.7 Summary of Site Risks

The BHHRA and BERA estimate the risks posed by contaminants at the site if no action were taken. These assessments provide the basis for taking action and identify the contaminants and exposure pathways that need to be addressed by the remedial action.

2.7.1 Summary of Human Health Risk Assessment

This section is based on the conclusions presented in the *Final Baseline Human Health and Screening Ecological Risk Assessment for the Group 2 Sites* (Jacobs, 2002), in the *Data Gaps Investigations* (Shaw, 2007b), and in additional data collected in preparation of the *Final Feasibility Study, LHAAP-29* (Shaw, 2010). The risk assessment used data from the investigations conducted through 1998 and the plant-wide perchlorate investigation conducted in 2000. Results from the later investigations conducted through 2014 did not change the overall outcome of the risk assessment

and the discussion of results and risks presented here are as presented in the Baseline HHRA and FS. During the risk assessment, soil and groundwater data were used to calculate the aggregate risk, which was then compared to the USEPA target risk range of 1×10^{-4} to 1×10^{-6} for the excess lifetime carcinogenic risk and to a hazard index (HI) of 1 for non-carcinogenic hazards. If there is no unacceptable risk associated with a medium, and a cleanup level is not exceeded, then the medium is not identified in this ROD for remediation. The CSM that is associated with the risk assessment was introduced in **Section 2.5.1**, and is presented as **Figure 2-7**.

2.7.1.1 Identification of Chemicals of Potential Concern

The BHHRA identified chemicals of potential concern (COPCs) for LHAAP-29 and evaluated the carcinogenic risk and non-carcinogenic hazard for each. **Table 2-1** summarizes the risk assessment data for the COPCs, including minimum and maximum detected concentrations, frequency of detection, and exposure point concentrations (EPCs). Analytical results for various congeners of dioxins and furans are expressed as 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) toxicity equivalence concentration (TEC).

2.7.1.2 Exposure Assessment

The Jacobs risk assessment (Jacobs, 2002) presented the human health risks and hazards to a hypothetical future maintenance worker under an industrial scenario for soil and groundwater.

For soil, reasonable exposure pathways according to the CSM are: incidental ingestion of the surface soil (0 to 2 feet bgs), dermal contact with the surface soil, inhalation of particulates, and inhalation of VOCs from the soil (0 to 7 feet bgs).

For groundwater, reasonable exposure pathways are ingestion of groundwater, dermal contact while showering with contaminated groundwater, and inhalation of VOCs while showering with contaminated groundwater.

2.7.1.3 Toxicity Assessment

The carcinogenic and non-carcinogenic toxicity assessments from the BHHRA are summarized in **Table 2-2** and **Table 2-3**, respectively. The toxicity data assumes that exposure would be chronic to be conservative. Sources for the data include the Integrated Risk Information System (IRIS) and Health Effects Assessment Summary Tables (HEAST).

2.7.1.4 Risk Characterization

Characterization of the carcinogenic risk and non-carcinogenic hazard are summarized in **Table 2-4** and **Table 2-5**, respectively. For carcinogens, risks are generally expressed as the incremental probability of an individual's developing cancer over a lifetime as a result of exposure to the carcinogen. Excess lifetime carcinogenic risk is calculated from the following equation:

$$Risk = CDI \times SF$$

where:
- risk = unitless probability of an individual developing cancer
- CDI = chronic daily intake averaged over 70 years, expressed as milligrams per kilogram per day (mg/kg-day)
- SF = slope factor, expressed as $(mg/kg\text{-}day)^{-1}$

These risks are probabilities that usually are expressed in scientific notation. An excess lifetime carcinogenic risk of 1×10^{-6} indicates that an individual experiencing the reasonable maximum exposure estimate has a 1 in 1,000,000 chance of developing cancer as a result of site-related exposure. This is referred to as an "excess lifetime carcinogenic risk" because it would be in addition to the risks of cancer that individuals face from other causes such as smoking or exposure to too much sun. The chance of an individual developing cancer from all other causes has been estimated to be as high as one in three. USEPA's generally acceptable risk range for site-related exposures is 1×10^{-4} to 1×10^{-6}.

The potential for non-carcinogenic effects is evaluated by comparing an exposure level over a specified time period (e.g., lifetime) with a reference dose (RfD) derived for a similar exposure period. An RfD represents a level that an individual may be exposed to that is not expected to cause any deleterious effect. The ratio of exposure to toxicity is called a hazard quotient (HQ). An HQ < 1 indicates that a receptor's dose of a single contaminant is less than the RfD, and that toxic non-carcinogenic effects from that chemical are unlikely. The HI is generated by adding the HQs for all COCs that affect the same target organ (e.g., liver) or that act through the same mechanism of action within a medium or across all media to which a given individual may reasonably be exposed. An HI < 1 indicates that, based on the sum of all HQ's from different contaminants and exposure routes, toxic non-carcinogenic effects from all contaminants are unlikely. An HI > 1 indicates that site-related exposures may present a risk to human health.

The HQ is calculated as follows:

Non-carcinogenic HQ = CDI/RfD

Where: CDI = chronic daily intake
RfD = reference dose

CDI and RfD are expressed in the same units and represent the same exposure period (e.g., chronic, subchronic, or short-term).

The carcinogenic risks for soil and groundwater are 7.3×10^{-6} and 3.9×10^{-1}, respectively (Jacobs, 2002). The carcinogenic risk for soil is within the USEPA target risk range of 1×10^{-4} to 1×10^{-6}. The HIs for soil and groundwater are 1 and 3,000, respectively, and are above the acceptable HI of < 1. The carcinogenic risks for groundwater are unacceptable; the non-carcinogenic risk for both soil and groundwater are unacceptable; therefore, the remedial action acts on both the soil and groundwater. Chemicals with a risk greater than 1×10^{-4} in groundwater include TCE, 1,2-DCA, arsenic, 2,4-DNT, 2,6-DNT, MC, chloroform, and 2,3,7,8-TCDD. Chemicals with a HQ greater than one in groundwater include 2-NT, 3-NT, arsenic, nickel, 2,4-DNT, 2,6-DNT, chloroform, perchlorate, TCE, and 1,2-DCA.

The BHHRA included an uncertainty analysis which identified factors that would cause values used in the risk assessment to be over or underestimated. The analysis concluded that the risks and HIs are overestimated, making the BHHRA a conservative evaluation. Additionally, the uncertainty analysis indicated a portion of the noncarcinogenic effects associated with antimony in groundwater at LHAAP-29 may be due to background.

2.7.1.5 Evaluation of COPCs

To further evaluate the occurrence of COPCs, a data gap investigation was conducted (Shaw, 2007b) and additional investigations were conducted when preparing the FS (Shaw, 2010). While

these investigations did not change the overall outcome of the earlier BHHRA, they determined the COPCs to be targeted by the remedial action.

Table 2-6 and **Table 2-7** list the chemicals in groundwater that exceed those values for the carcinogenic risk and HQ greater than 0.1, respectively. There is no carcinogenic risk in soil to the hypothetical maintenance worker. **Table 2-8** lists chemicals in the soil that have an HQ greater than 0.1 for the hypothetical maintenance worker. These tables also summarize the justifications for which of the COPCs should be classified as COCs. COPCs in soil were identified as COCs when they posed a carcinogenic risk above the acceptable range (risk greater than 1×10^{-4}) or when their HQ was greater than 1. COPCs in groundwater were identified as COCs when they posed a carcinogenic risk above the acceptable range (risk greater than 1×10^{-4}), when their HQ was greater than 1, or when the EPC was above the MCL or in the absence of federal drinking water standards, the TRRP Residential Groundwater PCL. Recent data obtained after the BHRRA investigation was used when possible. Based on the comparison of the maximum groundwater concentration since the BHHRA to their associated SDWA MCL or PCL, these COCs have been identified on **Table 2-10** to be of concern in the shallow and intermediate groundwater. **Table 2-10** presents the final list of COCs and all media, along with cleanup levels.

The human health risk assessment, which was based on the reasonably anticipated future use as a national wildlife refuge, does not address unrestricted use. In accordance with 30 TAC 335.566, a notification will be recorded in the Harrison County records stating that the site is suitable for nonresidential use.

2.7.2 Summary of Ecological Risk Assessment

The *Final Installation-Wide Baseline Ecological Risk Assessment* (Shaw, 2007a) and Baseline Ecological Risk Assessment Addendum (AGEISS, 2014) evaluated potential hazards to ecological resources at LHAAP by conducting a screening evaluation to identify initial COPECs in the individual sub-areas and watersheds. The potential of these COPECs to adversely affect communities was evaluated for: (1) organisms that have direct contact with the COPECs (e.g., plants and earthworms growing and living in contaminated soil); and (2) organisms that may be exposed to the chemicals via food chain pathways (e.g., ingestion of an earthworm living in the contaminated soil by a shrew). Potential impacts to invertebrate and plant communities were evaluated by comparing COPEC concentrations to benchmark values available from multiple literature sources. For the food chain exposure assessment, a number of measurement receptors were selected as representative species for the various trophic levels in the food web that could be at risk from contaminants in site media. The measurement receptors that were selected and used in the food chain evaluation included the following:

- Deer Mouse
- Raccoon
- Modified Raccoon (as a surrogate for the Louisiana Black Bear)
- Short-Tailed Shrew
- Red Fox
- Muskrat
- River Otter

- Townsend's Big-Eared Bat
- Common Snapping Turtle
- Bank Swallow
- American Woodcock
- Belted Kingfisher
- Red-Tailed Hawk

A food chain model was developed and used to estimate the total dose for each measurement receptor based on species-specific considerations such as diet, body weight, ingestion rates, etc., using conservative exposure estimates. Ecological hazard estimates were developed based on exposure to all media including soil in a particular sub-area and surface water and sediment from any watersheds present in the sub-areas. Two different soil depths were used for modeling exposure to ecological receptors: surface soil (0 to 0.5 foot) and total soil (0 to 3 feet). Each receptor was assumed to be exposed to one of the two depths based on its life history characteristics (e.g., burrowing animals were assumed to be exposed to total soil). Bioaccumulation of chemicals up the food chain was initially estimated using uptake factors obtained from available literature, and then refined using site-specific data obtained during the BERA. **Figure 2-8** presents the ecological conceptual model, which lays out the exposure pathways for selected species.

Ecological effects quotients (EEQ) were developed for each of the measurement receptors. EEQs are similar to HQs for human health, and are calculated by dividing the total dose that the receptor is exposed to by the toxicity reference value (TRV), which is based on a no-observed adverse effect level (NOAEL) or the lowest-observed adverse effect level concentration. If the EEQ exceeds 1 for a receptor (based on the NOAEL TRV), then that chemical is considered to have a realistic potential to cause adverse ecological impacts, and is identified as a final COPEC that should be addressed either through remediation or further investigation. As discussed in the BERA, there are several important uncertainties associated with the assumptions used in the EEQ process, and it should be noted that EEQs greater than 1 do not necessarily mean that ecological impacts have occurred, or are occurring.

Several sub-areas were established within LHAAP for the BERA. LHAAP-29 falls within the Industrial Sub-Area. For the industrial Sub-Area, four chemicals were selected as final COPECs: cadmium, chromium, zinc, and perchlorate. After that selection, additional sampling data became available and further analysis was performed, leading to the calculation of ecological preliminary cleanup levels (EcoPRGs) for several chemicals in soil. The final COPECs that were initially selected were found to not be of concern and EcoPRGs were calculated for six other chemicals: barium, lead, 2,4-DNT, 2,6-DNT, TNT, and 2,3,7,8-TCDD. Ecological hazards were found to be acceptable for the Industrial Sub-Area that includes LHAAP-29; however, elevated concentrations of NTs (TNT, 2,4-DNT and 2,6-DNT) were identified at one location at the site (Shaw, 2007a). Although NTs were not selected in the Industrial Sub-Area as final COPECs due to low frequency of detection and other considerations, the BERA evaluated measurement receptors and included a spatial analysis at this sample location at LHAAP-29. The results of this analysis identified that the NTs at this location and the adjacent areas may represent a small area of highly elevated concentrations (i.e., a hot spot) that could pose a threat to small-range ecological receptors either through acute toxicity, or as a source area for downgradient surface water transport of contamination (Shaw, 2007b). The EcoPRGs are shown on **Table 2-9**. An Excel spreadsheet analysis was performed by

ranking the detected concentrations of each final COPEC in the Industrial Sub-Area and iteratively re-calculating the 95% upper confidence limit (UCL) on the mean after removing concentrations until the 95% UCL for the Industrial Sub-Area was lower than the EcoPRG. (Note: as discussed in the BERA, the EcoPRG is not a “not to exceed” value for all concentrations; rather, it is a conservative estimate of the average concentration that results in no adverse effects, and as such is equivalent to the 95% UCL of chemical concentrations, rather than to individual sample concentrations.) The order of chemical concentrations was altered to preferentially remove LHAAP-29 samples in order to reduce the ecological risk in the Industrial-Sub Area. It is assumed that the locations associated with these concentrations will be remediated. The outcome of the analysis is included in **Table 2-10** and indicated on **Figure 2-12**.

After the BERA was completed in 2007, additional data review determined that some explosives results used in the BERA were invalid. Additional samples were collected during a data gaps investigation to replace the invalid results and the results were combined with the previously reported useable data and data from samples collected following completion of the BERA to re-evaluate the ecological risks. The results were reported in the BERA Addendum (AGEISS, 2014). The results of the re-evaluation indicated that that the replacement data collected during the data gaps investigation confirmed the conclusions of the BERA that no explosives compounds in soil should be identified as COPECs in the industrial sub-area. These results do not change the determination that the areas of elevated NTs at LHAAP-29 might pose a risk to small-range ecological receptors and should be addressed as part of the remedial action.

2.7.3 Basis of Action

The remedial action selected in this ROD is necessary to protect the public health or welfare or the environment from actual or threatened releases of hazardous substances, pollutants, or contaminants into the environment. Actions for the groundwater are necessary to address the potential for human health risks in the unlikely event there is an attempt to use groundwater as a potable water source.

Actions for soil are necessary to address human health risk including the pathway from soil to groundwater and ecological risks. **Table 2-10** presents the COCs and the final cleanup levels for both soil and groundwater with groundwater COCs for the shallow zone and the intermediate zone listed separately, which takes into account both ecological and human receptors.

The SDWA MCL is the cleanup level for the groundwater COCs. In the absence of federal drinking water standards, clean-up levels will be based on TRRP Residential Groundwater PCLs.

2.8 Remedial Action Objectives

The RAOs for LHAAP-29 presented in this ROD for the selected remedy and contingency remedy address contamination associated with the media at the site and take into account the future uses of LHAAP surface waters, land, and groundwater, are:

- Protection of human health by preventing human exposure to the contaminants in the soil, sediment, transite TNT wastewater line, vitrified clay cooling water lines, and groundwater
- Protection of human health and the environment by preventing the migration of contaminants to groundwater and surface water from potential sources in the soil, sediment, and process lines (TNT wastewater and cooling water)

- Protection of human health and the environment by preventing contaminated groundwater from migrating into nearby surface water
- Protection of ecological receptors by preventing exposure to the contaminated soil and sediment
- Return of groundwater to its potential beneficial uses, wherever practicable within a timeframe that is reasonable given the particular circumstances of the site (40 C. F. R. § 300.430(a)(1)(iii)(F)).

The above RAO recognizes USEPA's policy to return all groundwater to beneficial uses, based on non-binding programmatic expectation in the NCP, and is consistent with the NCP regulations requiring the lead agency to establish RAOs specifying contaminants and media of concern, potential exposure pathways, and remediation goals.

Per these RAOs, and consistent with the NCP, groundwater will be returned to its beneficial use. In the absence of federal drinking water standards, the groundwater clean-up level at the Site is the TRRP Residential Groundwater PCL and is protective of human health and the environment.

2.9 Description of Alternatives

Four alternatives (including No Action) were evaluated. This section introduces the remedy components, identifies the common elements and distinguishing features of each alternative, and describes the expected outcomes of each.

2.9.1 Description of Remedy Components

Alternative 1 – No Action
As required by the NCP, the no action alternative provides a comparative baseline against which the action alternatives can be evaluated. Under this alternative, groundwater would be left "as is" without implementing any additional monitoring, containment, removal, treatment, or other mitigating actions. No actions would be implemented to reduce existing or potential future exposure to human and ecological receptors, although natural attenuation would be ongoing.

Estimated Capital Present Worth Cost: $0
Estimated O&M Present Worth Cost: $0
Cost Estimate Duration: NA
Estimated Present Worth Cost: $0

Alternative 2 – Excavation and Off-site Disposal for Soil; Plug Lines; In-situ Chemical Oxidation, MNA and LUCs for Intermediate Zone and Shallow Zone Groundwater
The major components of this alternative include the following:

- Excavation and off-site disposal of impacted soil from LHAAP-29 to protect human and ecological receptors, and to eliminate the potential soil-to-groundwater pathway
- Cooling water and transite TNT process wastewater lines will be flushed with water, inspected, and plugged using a bentonite slurry. Confirmation sampling of the wooden TNT wastewater line during the RD may result in excavation and disposal.

- Injection of chemical oxidant in targeted locations in the intermediate groundwater zone to oxidize organic constituents in the saturated zone and extraction of groundwater to help distribute oxidant with MNA following treatment
- MNA with LTM in the intermediate zone (after chemical oxidation is complete) to reduce groundwater contamination to cleanup levels
- MNA with LTM in the shallow zone to reduce groundwater contamination to cleanup levels
- A contingency remedy to enhance MNA if MNA is found to be ineffective. The contingency remedy would consist of injection of bioremediation amendments to enhance degradation of the groundwater contaminants at selected locations based on data available at the time it is determined MNA is not successful. Details for the contingency remedy would be presented in a RD/RAWP.
- Groundwater monitoring will be conducted to evaluate inorganic COCs. The need to continue groundwater monitoring for this purpose will be evaluated at five year reviews.
- LTM semiannually for 3 years, annually until the next five-year review, then annually until recommended otherwise at the five-year review to evaluate remedy performance and determine if plume conditions remain constant, improve, or worsen. Monitoring will continue until the five-year review demonstrates that cleanup levels are reached
- The LUCs' performance objectives are to prohibit groundwater use (except for environmental testing and monitoring) as a potable source until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met; to restrict land use to nonresidential until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; and to maintain the integrity of any current or future remedial or monitoring systems until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10** in groundwater are met.

Estimated Capital Present Worth Cost: $8,070,000
Estimated O&M Present Worth Cost: $1,070,000
Cost Estimate Duration: 30 years
Estimated Present Worth Cost: $9,140,000

Alternative 3 – Excavation and Off-site Disposal of Soil; Plug Lines; Intermediate Zone Groundwater Extraction and Treatment, MNA and LUCs for Intermediate and Shallow Groundwater

The major components of this alternative include the following:

- Excavation and off-site disposal of impacted soil from LHAAP-29 to protect human and ecological receptors, and to eliminate the potential soil-to-groundwater pathway
- Cooling water and transite TNT process wastewater lines will be flushed with water, inspected, and plugged using a bentonite slurry. Confirmation sampling of the wooden TNT wastewater line during the RD may result in excavation and disposal.

- Groundwater extraction to reduce VOC levels throughout the intermediate zone groundwater contaminant plume to favorable conditions for MNA
- MNA with LTM in the intermediate zone (after groundwater extraction) to reduce groundwater contamination to cleanup levels
- MNA with LTM in the shallow zone to reduce groundwater contamination to cleanup levels
- A contingency remedy to enhance MNA if MNA is found to be ineffective. The contingency remedy would consist of injection of bioremediation amendments to enhance degradation of the groundwater contaminants at selected locations based on data available at the time it is determined MNA is not successful. Details for the contingency remedy would be presented in a RD/RAWP.
- Groundwater monitoring will be conducted to evaluate inorganic COCs. The need to continue groundwater monitoring for this purpose will be evaluated at five year reviews.
- LTM semiannually for 3 years, annually until the next five-year review, then annually until recommended otherwise at the five-year review to evaluate remedy performance and determine if plume conditions remain constant, improve, or worsen. Monitoring will continue until the five-year review demonstrates that cleanup levels are reached
- The LUCs' performance objectives are to prohibit groundwater use (except for environmental testing and monitoring) as a potable source until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met; to restrict land use to nonresidential until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; and to maintain the integrity of any current or future remedial or monitoring systems until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met.

Estimated Capital Present Worth Cost: $1,550,000
Estimated O&M Present Worth Cost: $1,780,000
Cost Estimate Duration: 30 years
Estimated Present Worth Cost: $3,300,000

Alternative 4 - Excavation and Off-site Disposal for Soil; Plug Lines; ISTD, MNA and LUCs for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater
The major components of this alternative include the following:

- Excavation and off-site disposal of impacted soil from LHAAP-29 to protect human and ecological receptors, and to eliminate the potential soil-to-groundwater pathway
- Cooling water and transite TNT process wastewater lines will be flushed with water, inspected, and plugged using a bentonite slurry. Confirmation sampling of the wooden TNT wastewater line during the RD may result in excavation and disposal.
- One of two ISTD process options, ERH (Alternative 4a) or TCH (Alternative 4b) will be selected during the remedial design phase and implemented to remediate the MC DNAPL plume in the intermediate zone to levels amenable to MNA

- MNA with LTM in the intermediate groundwater zone (after ISTD activities are complete) to reduce groundwater contamination to cleanup levels
- MNA with LTM in the shallow zone to reduce groundwater contamination to cleanup levels
- A contingency remedy to enhance MNA if MNA is found to be ineffective. The contingency remedy would consist of injection of bioremediation amendments to enhance degradation of the groundwater contaminants at selected locations based on data available at the time it is determined MNA is not successful. Details for the contingency remedy would be presented in a RD/RAWP.
- Groundwater monitoring will be conducted to evaluate inorganic COCs. The need to continue groundwater monitoring for this purpose will be evaluated at five year reviews.
- LTM semiannually for 3 years, annually until the next five-year review, then annually until recommended otherwise at the five-year review to evaluate remedy performance and determine if plume conditions remain constant, improve, or worsen. Monitoring will continue until the five-year review demonstrates that cleanup levels are reached
- The LUCs' performance objectives are to prohibit groundwater use (except for environmental testing and monitoring) as a potable source until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met; to restrict land use to nonresidential until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; and to maintain the integrity of any current or future remedial or monitoring systems until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met.

Alternative 4a:

Estimated Capital Present Worth Cost: $3,710,000
Estimated O&M Present Worth Cost: $1,030,000
Cost Estimate Duration: 30 years
Estimated Total Present Worth Cost: $4,740,000

Alternative 4b:

Estimated Capital Present Worth Cost: $4,530,000
Estimated O&M Present Worth Cost: $1,190,000
Cost Estimate Duration: 30 years
Estimated Total Present Worth Cost: $5,720,000

2.9.2 Common Elements and Distinguishing Features

Common Elements of Alternative 2, 3, and 4

Common elements of Alternatives 2, 3, and 4 are described below.

Soil Excavation –Contaminated soil would be excavated at LHAAP-29 under Alternatives 2, 3, and 4 to prevent human and ecological receptor exposure to contaminants in the soil and to eliminate the soil-to-groundwater pathway. As part of the RD, confirmation soil samples will be collected along

the north and south cooling water lines as well as the TNT wastewater lines to confirm that leaching has not occurred, which may identify additional soil excavation areas. Disposal will be at a RCRA Subtitle D-permitted landfill.

Process Lines – Transite TNT wastewater line would be flushed, then the inlets and outlets will be inspected and plugged with a bentonite slurry mix or equivalent. The cooling water lines will be evaluated further during the RD in order to base the remedial action on up-to-date data. The lines will be flushed with water, inspected and plugged using a bentonite slurry mix or equivalent. Rinsate water will be containerized and characterized for waste handling. During the RD, samples will be collected from the soil along the deteriorated wooden TNT wastewater line and analyzed for explosives to determine if there are concentrations that represent a potential source for groundwater contamination. If present, above the GWP-Ind, the affected soils may be included in the excavation and disposal activity.

MNA – MNA is a passive remedial action that relies on natural biological, chemical, and physical processes to reduce the mass and concentrations of groundwater COCs under favorable conditions. The natural attenuation evaluation indicates that MNA is a feasible technology for the groundwater at LHAAP-29 (Shaw, 2010). Monitoring activities associated with MNA would confirm the protection of human health and the environment by documenting the return of the groundwater to its potential beneficial use as a drinking water supply, and by documenting reduction of the contaminant mass and protection of surface water through containment of the plume. In all three alternatives, contaminant reduction would occur by MNA alone in the shallow zone. For the intermediate zone, to achieve conditions favorable to MNA, MC would be reduced by chemical oxidation in Alternative 2, groundwater extraction in Alternative 3, and thermal destruction in Alternative 4.

MNA performance monitoring would be conducted quarterly for the first two years. After eight quarterly sampling events, MNA effectiveness will be evaluated. The analytical program would consist of VOCs, including chlorinated compounds and degradation products, nitrotoluenes, methane, ethene, and ethane, among others. The full list of MNA parameters would be developed during the RD phase.

Inspection/Long-Term Groundwater Monitoring – Alternatives 2, 3, and 4 include inspection and long-term groundwater monitoring activities. Monitoring would be continued as required to evaluate the effectiveness of the remedy, to demonstrate compliance with applicable or relevant and appropriate requirements (ARARs) and RAOs, and to support five-year reviews.

LUCs – LUCs would be implemented to support the RAOs. The LUC for groundwater would prevent human exposure to residual groundwater contamination presenting an unacceptable risk to human health and ensure that there is no withdrawal or use of groundwater beneath the sites for anything other than environmental monitoring and testing. The LUC to prohibit groundwater use (except for environmental testing and monitoring) as a potable source would remain until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met; to restrict land use to nonresidential until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; and to maintain the integrity of any current or future remedial or monitoring systems until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met.

In addition, within 90 days of signature of this ROD, the Army shall request the Texas Department of Licensing and Regulation to notify well drillers of groundwater use prohibitions based on a preliminary LUC boundary. A LUC Remedial Design (RD) will be finalized as the land use component of the Remedial Design. Within 21 days of the issuance of the ROD, the Army will propose deadlines for completion of the RD Work Plan, RD, and Remedial Action Work Plan. The documents will be prepared and submitted to EPA and TCEQ pursuant to the FFA. The LUC RD will contain implementation and maintenance actions, including periodic inspections. The long-term groundwater and surface water monitoring and MNA performance monitoring will also be presented in the RD. Consistent with the dates presented for these documents, the U.S. Army shall: 1) request the Texas Department of Licensing and Regulation to notify well drillers of the final boundary of groundwater use prohibitions; and 2) notify the Harrison County Courthouse of the LUCs to include a map showing the areas of groundwater and nonresidential use restrictions, and the monitoring system at the site, in accordance with 30 TAC 335.565.

The Army will implement, maintain, monitor, report on and enforce land use controls at Army-owned property. The Army shall perform those actions related to land use control activities described in this ROD and in the Remedial Design for the ROD. For portions of the Site subject to land use controls that are not owned by the Army, the Army will monitor and report on the implementation, maintenance, and enforcement of land use controls, and coordinate with federal, state, and local governments and owners and occupants of properties subject to land use controls. The Army will provide notice of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. The Army will send these notices to the federal, state and local governments involved at this site and the owners and occupants of the properties subject to those use restrictions and land use controls. The Army shall provide the initial notice within 90 days of ROD signature. The frequency of subsequent notifications will be described in the Remedial Design for the ROD. The Army remains responsible for ensuring that the remedy remains protective of human health and the environment. The Army will fulfill its responsibility and obligations under CERCLA and the NCP as it implements, maintains, and reviews the selected remedy.

Upon transfer of Army-owned property, the Army will provide written notice of the land use controls to the transferee of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. Within 15 days of transfer, the Army shall provide EPA and TCEQ with written notice of the division of implementation, maintenance, and enforcement responsibilities unless such information has already been provided in the LUC RD. The LUC RD will address the procedures to be used by the Army and the transferee to document compliance with the LUCs described in this ROD. In the event property is transferred out of Federal control, the land use controls relating to property and groundwater restrictions shall be recorded in the deed and shall be enforceable by the United States and the state of Texas.

To transfer this property (LHAAP-29), an Environmental Condition of Property (ECP) document would be prepared and the Environmental Protection Provisions from the ECP would be attached to the letter of transfer. The ECP would include the LUCs as part of the Environmental Protection Provisions. The property would be transferred subject to the LUCs identified in the ECP. These restrictions would prohibit or restrict property uses that might result in exposure to the contaminated groundwater (e.g., drilling restrictions) or soil (e.g., residential land use prohibition).

The U.S. Army and regulators will consult to determine appropriate enforcement actions should there be a failure of a LUC objective at these sites after they have been transferred.

Distinguishing Feature of Alternative 2

The distinguishing feature of Alternative 2 compared to Alternatives 3 and 4 is the inclusion of ISCO to treat the MC DNAPL in the intermediate groundwater zone. These actions are described below. Note that the design specifications presented below are used for cost estimating purposes and the final design for the selected remedy will be presented in the Remedial Design document.

In situ chemical oxidation – The components of this action include:

Installation of injection wells. Four intermediate zone injection wells (88 feet bgs) would be installed around existing intermediate monitoring well 29WW16, where MC was detected at the highest concentration. The four wells would be arranged in a square with well 29WW16 in the center of the square. The spacing may be adjusted based on actual field conditions.

Injection of oxidation solution. One pore volume of heat activated (40 degrees Celsius [ºC]) combined persulfate and sodium hydroxide solution at 60 grams per liter (g/L) and 15 g/L, respectively, would be injected into four wells while simultaneously extracting groundwater from well 29WW216. Temporary piping would be used for the injection array. The estimated volume is approximately 187,000 gallons of activated persulfate and sodium hydroxide solution to be injected into the subsurface. The solution is estimated to be 94,000 pounds of persulfate reagent and 23,500 pounds of sodium hydroxide. A second round of injection may be required if monitoring indicates COCs are not being effectively reduced from the initial round. For the cost estimate, a second round is assumed. If contaminant concentrations do not decrease as anticipated, the method would be modified.

Simultaneous extraction of groundwater. Well 29WW16, or an equivalent, would be converted to an extraction well. Prior to conversion, a pumping test would be conducted and hydrogeologic parameters would be measured to assess aquifer conditions. Groundwater flow in the vicinity of 29WW16 and the injection wells would be modeled to determine the scope of the modifications needed at 29WW16 and to assess the time required to extract one pore volume.

For estimating purposes, it is assumed the on-site groundwater treatment plant is operating and can handle 187,000 gallons extracted for one pore volume. A temporary piping system would be used to convey the extracted water to three 5,000-gallon on-site storage tanks. The on-site tanks would be interconnected and would be equipped with a high level shut off to the extraction pump. Once every two days, water would be pumped into a tank truck and transported to the LHAAP groundwater treatment plant for treatment and discharge (**Figure 2-14**). A 20-foot by 50-foot gravel pad would be prepared for the tanks, and a 6-inch-layer of gravel would be placed to upgrade the road to the tanks at LHAAP-29. Based on the pumping test results, the quantities of extracted water and best approach to handle the water would be evaluated.

Monitor effectiveness. To monitor the effectiveness of the in situ chemical oxidation, six wells would be monitored biweekly for three sampling events. The six wells would include one new monitoring well, four injection wells, and 29WW16. The effect of the first chemical injection should be evident within a few weeks. It is anticipated that a second injection may be needed after approximately 2 months.

Distinguishing Feature of Alternative 3

The distinguishing feature of Alternative 3 compared to Alternatives 2 and 4 is the inclusion of groundwater extraction to address contamination in the intermediate groundwater zone.

Groundwater extraction is estimated to require 3 years to reduce concentrations to levels amenable to MNA. These actions are described below. Note that the design specifications presented below are used for cost estimating purposes and the final design for the selected remedy will be presented in the Remedial Design document.

Pre-Design Study: This action would begin with a pre-design study. A pump test would be conducted and hydrogeologic parameters would be measured to better design the system. Groundwater flow would be modeled to set performance evaluation parameters and to assess the likely time required for remediation.

Construction: Groundwater contamination in the intermediate zone at LHAAP-29 primarily consists of a MC plume. A minimum of five additional wells (four extraction and one monitoring) are proposed to be installed in the intermediate zone within the region of greatest MC contamination in order to provide a more effective extraction process. Several groundwater monitoring wells are located throughout the site and some of these could also be converted to extract contaminated groundwater if needed. The final number and locations for extraction wells would be determined as part of the pre-design study.

Storage and transport of extracted groundwater: A piping system would be constructed to transport the extracted water from the extraction wells 5,000-gallon storage tanks to be located on-site at LHAAP-29. The tanks would be interconnected and equipped with a high level shut off to the pump. Once every two days or at a determined frequency, the water would be pumped into a tank truck and transported to the existing groundwater treatment plant for treatment and discharge.

Performance Monitoring: During extraction, samples would be collected from the extraction wells and monitoring wells to monitor the effectiveness of the action. During startup of the extraction system (until the system is operating properly), bimonthly sampling would be conducted. Startup is estimated to be approximately six months. After startup, monitoring would be reduced to quarterly for the remaining 2.5 years.

Water Treatment and Discharge: The extracted groundwater from LHAAP-29 would be treated at the LHAAP groundwater treatment plant, which was originally built to treat groundwater containing VOCs and metals extracted from other LHAAP sites. The plant uses air stripping, carbon adsorption, and thermal oxidation. Perchlorate treatment using a fluidized bed reactor was added in April 2001 to the treatment plant. The extracted water from LHAAP-29 would be discharged from the tank truck into the existing 300,000-gallon equalization tank. This tank receives water from other LHAAP sites and is stored in this tank until treatment. After the water is treated, the effluent would be discharged in accordance with plant procedures. The plant presently operates at a fraction of its maximum capacity of 1 to 1.5 million gallons of water per month. The original groundwater treatment plant components have adequate capacity to accommodate the increase in volume that would be introduced to the system when the contaminated groundwater is transported from LHAAP-29 to the plant. The system capacity is limited by effluent storage and discharge rate, and this concern was addressed. Recent mitigating measures include the replacement of the reinjection pipeline to increase the pipe diameter to 4-inches, and the installation of a sprinkler system. The capacity issue would be revaluated as necessary during the remedial action.

Extraction System: Operation and maintenance would include groundwater extraction system maintenance, groundwater treatment plant operations, and environmental media monitoring. In three years, the extraction wells are anticipated to remove the highest concentrations of VOCs from the groundwater intermediate zone at LHAAP-29, thus reducing the contaminant mass to make

conditions favorable for MNA (estimate assumes 3 years). For MNA, four wells would be selected for use as monitoring wells, and monitoring would be implemented to demonstrate that any remaining VOCs are attenuated by natural processes. During the groundwater extraction operations, the extraction wells would require regular maintenance to prevent fouling of well screens, and the extraction pumps would require routine maintenance and may also require replacement. Cleaning of the pipelines, refurbishing pumps and other maintenance activities would be needed on the groundwater collection and transport system during full-scale operation. O&M costs would include the addition of chemicals, power, and labor; equipment cleaning, tank cleaning, general system maintenance, and replacement; and regulatory monitoring and reporting. O&M activities would also be conducted at the LHAAP plant location as part of the routine plant O&M activities.

Distinguishing Feature of Alternative 4

The distinguishing feature of Alternative 4 compared to Alternatives 2 and 3 is the inclusion of ISTD to remediate the MC DNAPL in the intermediate groundwater zone. Alternative 4a, using ERH as the ISTD process, or 4b using TCH as the ISTD process would be selected during the remedial design phase. Thermal desorption operates by heating the subsurface to effectively and quickly volatilize large quantities of VOCs, including those in the form of non-aqueous phase liquid. Available technologies include ERH, TCH, and steam injection, which are typically coupled with a soil vapor extraction (SVE) system and above ground emission controls to capture and/or destroy volatilized VOCs. Pumping of groundwater or multi-phase extraction (MPE) may also be required to contain the mobilized VOCs in groundwater.

These actions are described below. Note that the design specifications presented below are used for cost estimating purposes and the final design for the selected remedy will be presented in the Remedial Design document. The proposed ERH concept developed for this site and used to develop costs presented in the FS does not include a groundwater extraction component, while the proposed TCH concept incorporated groundwater extraction as part of the MPE component. The TCH conceptual design is significantly more robust than the one proposed for ERH, which may in part explain the difference in total cost between Alternatives 4a and 4b. The actual number of heater wells and the need for groundwater extraction would require further evaluation during the remedial design phase. ISTD for either process option would include extraction of vapors and potentially concurrent groundwater extraction. The need for MPE would be determined during the RD phase. Condensate would be removed from the extracted vapors, which would subsequently be treated in a thermal oxidizer for the destruction of the chlorinated VOCs. Hydrogen chloride generated by combustion of chlorinated compounds would be treated in an acid gas scrubber before discharge to ambient air. If groundwater extraction is required, the extracted water would be combined with the condensate removed from the extracted vapors and transported via truck to the existing groundwater treatment plant (GWTP).

Alternative 4a, In-situ thermal desorption using ERH – ERH delivers electricity through subsurface media via an array of electrodes. The heat generated by electrical resistance typically can raise subsurface temperatures to around the boiling point of water. The steam produced from pore-water serves as a medium to carry out volatilized VOCs for capture via SVE and subsequent ex-situ treatment of extracted vapors. Contaminants are also directly volatilized from unsaturated soil and the applied heat can increase hydrolysis of chlorinated solvents, such as MC, and promote in-situ biological activity. Treatment duration is estimated at 65 – 87 days. The components of the ERH technology for Alternative 4a include:

Installation of electrode borings: An array of electrode borings with co-located vapor extraction wells. The specific depths and layout of the array would be determined during the RD. Temperature monitoring probes would also be installed.

Vapors: The extracted vapor would require treatment to remove VOCs. Although activated carbon is proposed in the vendor's conceptual design, it is assumed that the mass loading would require a thermal oxidizer for treatment of the vapors. The airflow rate is estimated at 320 standard cubic feet per minute (scfm).

Storage, transfer, and treatment of extracted water: Condensate from the co-located vapor extraction wells would be collected and stored in an above-ground tank prior to transfer to the GWTP for treatment and disposal.

Alternative 4b, In-situ thermal desorption using TCH - Thermal conduction is the process of heat flow from a high temperature area to a lower temperature area. TCH involves applying heat and vacuum simultaneously to subsurface media with an array of vertical heater/vacuum wells, thus heating up solids (soil and rock) and liquids (water, air and non-aqueous phase liquids). The heat moves out radially from each thermal well until the heat fronts overlap. Thermal conductivities of subsurface materials, such as sands, silt, and clay show little variability, which leads to highly predictable in-situ heating even in challenging heterogeneous settings. Heating of the wells can either be accomplished by electrically-powered heater coils or using combustion of fuels (e.g. natural gas or propane).

Transport of the vaporized contaminants is improved by the creation of permeability, which results from drying and, if clay is present, shrinking of the soil close to the heaters causing the formation of preferential flow paths that allow capture of the vaporized contaminants. The target temperature for TCH is typically the boiling temperature of the groundwater (e.g. 100 degrees Celsius [ºC] at a pressure of 1 atmosphere). The steam produced from the groundwater serves as a medium to carry out volatilized VOCs. In addition, the applied heat can increase hydrolysis and promote in-situ biological activity. Treatment duration estimated at 180 days.

The components of the TCH technology for Alternative 4b include:

Installation of heater wells: An array of heater wells with co-located vapor extraction wells. The specific depths and layout of the array would be determined during the RD. Temperature monitoring probes would also be installed.

Vapor treatment: The extracted vapor would require treatment to remove VOCs. Although activated carbon is proposed in the vendor's conceptual design, it is assumed that the mass loading would require a thermal oxidizer for treatment of the vapors. Assumed airflow rate is 320 scfm

Storage, transfer, and treatment of extracted water: Condensate from the co-located vapor extraction wells would be collected and stored in an above-ground tank prior to transfer to the GWTP for treatment and disposal

2.9.3 Expected Outcomes of Each Alternative

Alternative 1 would allow the site to remain a hazard to human and ecological receptors, since it simply leaves the site as is. Alternatives 2, 3, and 4 provide the same outcome to mitigate exposure to human and ecological receptors by excavation and off-site disposal of the contaminated soil. Soil excavation would also eliminate the potential soil-to-groundwater pathway, preventing further

degradation of groundwater from contaminated soil. Alternatives 2, 3, and 4 would significantly and permanently reduce groundwater contaminant concentrations to the applicable cleanup levels and, therefore, provide long-term effectiveness and permanence. This would be achieved by implementing MNA after the implementation of the initial active treatments from Alternatives 2, 3, and 4 to reduce the VOC contaminant concentrations in the intermediate groundwater zone. These include ISCO for Alternative 2, groundwater extraction (pump and treat) for Alternative 3, and ISTD for Alternative 4. Cleanup levels for the shallow zone should be achieved through MNA in approximately 70 years, and in the intermediate zone the cleanup levels should be achieved through MNA following extraction or active treatment in approximately 90 years for Alternatives 2 and 3, and 5-10 years for Alternatives 4a and 4b. However, considering the lithologic variability, particularly the lateral and vertical change from sand to clay, the times to achieve the cleanup levels may vary by an order of magnitude. The similar outcomes are considered to be attainment of the SDWA MCLs to the extent practicable, and consistent with 40 C.F.R. § 300.430(e)(2)(i)(B & C). If no SDWA MCL has been promulgated for a contaminant, the TRRP Residential Groundwater PCL is used in place of the SDWA MCL. In addition, the monitoring activities associated with MNA would confirm the protection of human health and the environment by documenting the return of the groundwater to its potential beneficial use as a drinking water supply to the extent practicable, given the particular circumstances of the site, by documenting reduction of the contaminant mass and protection of surface water through containment of the plume.

The LUC will remain in place to prohibit groundwater use (except for environmental testing and monitoring) as a potable source until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met; to restrict land use to nonresidential until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure; and to maintain the integrity of any current or future remedial or monitoring systems until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met.

2.10 Summary of Comparative Analysis

Nine criteria identified in the NCP 40 C.F.R. § 300.430(a)(1)(iii)(F) are used to evaluate the different remediation alternatives individually and against each other in order to select a remedy. This section profiles the relative performance of each alternative against the nine criteria, noting how it compares to the other options under consideration. The nine evaluation criteria are discussed below. **Table 2-11** summarizes the comparative analysis of the alternatives.

2.10.1 Overall Protection of Human Health and the Environment

Overall protection of human health and the environment addresses whether each alternative provides adequate protection of human health and the environment and describes how risks posed through each exposure pathway are eliminated, reduced, or controlled, through treatment, engineering controls, and/or land use controls.

The four alternatives provide varying levels of human health protection. Alternative 1, no action, does not confirm achievement of the RAO for the return of groundwater to its potential beneficial use because there is no monitoring involved. Alternative 1 also provides the least protection of all the

alternatives; it provides no reduction in risks to human health or the environment because no measures would be implemented to eliminate the pathway for human exposure to soil or to the groundwater contamination and potential groundwater impacts to Central Creek and Goose Prairie Creek would not be addressed. Additionally, the soil pathway for ecological receptors would not be addressed.

Alternatives 2, 3, and 4 satisfy the RAOs for LHAAP-29. Alternatives 2, 3, and 4 would remove the contaminated soil and solid residue in lines that pose a hazard, and provide confirmation that human health and the environment would be protected because the monitoring would be conducted to show that MNA is returning the groundwater in the contaminated shallow and intermediate groundwater zones at LHAAP-29 to its potential beneficial use as a drinking water supply to the extent practicable, given the particular circumstances of the site, and to document that the plumes are contained and prevented from impacting surface water at levels that could present a risk to human health and the environment. Furthermore, the LUC for groundwater would protect human health by preventing access to the contaminated groundwater until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soils and groundwater allow for unlimited use and unrestricted exposure. Alternatives 2, 3 and 4 provide treatment of the primary COC, MC, for human health in the intermediate zone.

2.10.2 Compliance with ARARs

Section 121(d) of CERCLA and 40 C.F.R. § 300.430(f)(1)(ii)(B) require that remedial actions at CERCLA sites attain legally applicable or relevant and appropriate Federal and state requirements, standards, criteria, and limitations, which are collectively referred to as “ARARs”, unless such ARARs are waived under CERCLA Section 121(d)(4). The ARARs that pertain to this ROD are discussed in **Section 2.13.2**.

Because contaminated groundwater has the potential to flow into Goose Prairie Creek which flows to Caddo Lake, a drinking water supply, chemical-specific ARARs for surface water consumption are appropriate and relevant. Specifically, Texas surface water quality standards are set forth in 30 TAC 307.6(d)(1), Table 2, for MC, TCE, 1,2-DCA, 1,1-DCE, and VC. For those COCs not listed in Table 2, including perchlorate, cis-1,2-DCE, trans-1,2-DCE, and explosives, the TRRP Residential Groundwater PCLs for those COCs would apply.

Alternative 1 does not comply with chemical-specific ARARs because no remedial action or measures would be implemented. Alternatives 2, 3, and 4 do comply with all chemical-specific ARARs for soil because the contaminated soil above the chemical-specific ARAR would be removed. Alternatives 2, 3, and 4 comply with all chemical-specific ARARs for groundwater because they would return the contaminated shallow and intermediate groundwater zones at LHAAP-29 to their potential beneficial use as drinking water, wherever practicable, which for the purposes of this ROD is considered to be attainment of the relevant and appropriate cleanup levels (SDWA MCLs or TRRP Residential Groundwater PCLs if no SDWA MCL is available) to the extent practicable, and consistent with 40 C.F.R. § 300.430(e)(2)(i)(B & C) and 30 TAC 335.559(d)(2). If a return to potential beneficial uses is not practicable, these alternatives would still meet the NCP expectation to prevent further migration of the plume, prevent exposure to the contaminated groundwater, and evaluate further risk reduction. While Alternative 3 provides a level of overall protection similar to Alternatives 2 and 4, Alternatives 2 and 4 would accelerate the MC cleanup in the intermediate zone. Alternative 4 would achieve the cleanup in the shortest period of time, 5-10 years of MNA after active treatment is completed, compared with 90 years of MNA for Alternatives 2 and 3.

Location-specific and action-specific ARARs would not apply to Alternative 1 since no remedial activities would be conducted. Alternatives 2, 3, and 4 would comply with all action-specific ARARs. There are no location-specific ARARs for Alternatives 2, 3, or 4.

2.10.3 Long-Term Effectiveness and Permanence

Long-term effectiveness and permanence refers to expected residual risk and the ability of a remedy to maintain reliable protection of human health and the environment over time, once clean-up levels have been met. This criterion includes the consideration of residual risk that will remain on-site following remediation and the adequacy and reliability of controls.

Alternative 1 would be the least effective and permanent in the long term because no contaminant source removal or treatment would take place and no measures would be implemented to control exposure risks posed by contaminated site soil, sediment, surface water and groundwater. Alternative 1 would also have no effectiveness and permanence with regards to the contaminated soil, since no soil removal would be conducted.

Removing the source soils and either removing the contaminated groundwater through extraction, or using active treatment to destroy VOCs in the DNAPL plume would provide a permanent solution for the contaminants in affected media.

Alternatives 2, 3, and 4 would provide a moderate degree of long-term effectiveness by removing the source soils and providing restoration of the groundwater by treatment and/or MNA. Alternatives 2 and 4 provide a higher level of effectiveness than Alternative 3because the intermediate groundwater zone would reach concentrations amenable to natural attenuation in a shorter time frame. Alternative 4 would provide the highest level of effectiveness since the intermediate zone groundwater would reach cleanup levels in the shortest timeframe. Alternative 2 allows the opportunity to evaluate the impact of the in-situ treatment and re-inject if necessary. The impact of the ISTD performed under either of the process options for Alternative 4 would also be evaluated to determine whether additional treatment may be necessary. Alternative 3 is as effective and permanent as Alternatives 2 and 4, but would require more time to reduce concentrations amenable to MNA than Alternatives 2 or 4 and would require a longer period of active operations and maintenance. Alternatives 2 and 4 would significantly reduce initial groundwater contaminant concentrations and thereafter rely on natural attenuation and LUCs until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soils and groundwater allow for unlimited use and unrestricted exposure. Monitoring activities associated with MNA would confirm the protection of human health and the environment by documenting the return of the groundwater to its potential beneficial use as a drinking water supply to the extent practicable, by documenting reduction of the contaminant mass and protection of surface water through containment of the plume.

LUCs would provide a moderate to high degree of effectiveness by limiting land use and preventing exposure to contaminated media. As a federally owned property that will remain so as a refuge after transfer, the ability to achieve permanence and effectiveness is greatly enhanced.

The removal of contaminated solid residue from the transite wastewater line and from the cooling water lines would provide a high degree of long-term effectiveness and permanence by removing the contaminated solid residue from the site.

2.10.4 Reduction of Toxicity, Mobility, or Volume Through Treatment

Reduction of toxicity, mobility, or volume through treatment refers to the anticipated performance of the treatment technologies that may be included as part of a remedy.

Alternative 1 does not employ treatment and would not result in a reduction of toxicity, mobility, or volume of contaminants. Alternative 2 would use excavation, ISCO, and natural attenuation to permanently reduce the mass and concentration of contaminants and, therefore, the toxicity, mobility, and volume of the contaminants. In-situ chemical oxidation is an active treatment process.

Alternative 3 would use excavation, groundwater extraction, and natural attenuation to achieve the same reductions in contamination that are expected from Alternative 2. Groundwater extraction is an active treatment process and would reduce toxicity and volume of the contaminants.

Alternative 4 would use excavation, ISTD, and natural attenuation to permanently reduce the mass and concentration of contaminants and, therefore, the toxicity, mobility, and volume of the contaminants. ISTD is an active treatment process.

Biological activity would generate daughter products that may temporarily increase toxicity or mobility of the contaminant plume. Alternatives 2, 3, and 4 include monitoring so that daughter products would be quantified, documented, and evaluated. The same biological activities would also consume the daughter products, and it is anticipated that these concentrations would be reduced to levels below their associated cleanup levels to return groundwater to its potential beneficial use, wherever practicable.

There is an NCP expectation to use treatment to address principal threat wastes, wherever practicable. Alternatives 2, 3, and 4 satisfy the NCP expectation by including treatment components that address the potential for principal threat wastes associated with the high concentrations of MC in the intermediate groundwater zone.

The soil excavation in Alternatives 2, 3, and 4 would reduce mobility because perchlorate and explosive contaminated soils would be removed from the site and placed in a permitted disposal facility. Toxicity and volume would not be reduced by the excavation portion of the alternatives as the form and quantity of contaminants would not be altered.

The removal of contaminated solid residue from the transite wastewater line and cooling water lines by flushing with water in Alternatives 2, 3, and 4 would reduce mobility because the solid residue would be removed from the site and the rinsate collected, analyzed by the toxicity characteristic leaching procedure (TCLP), and properly disposed. Toxicity and volume would not be reduced since quantity of the contaminants would not be altered.

2.10.5 Short-Term Effectiveness

Short-term effectiveness addresses the period of time needed to implement the remedy and any adverse impacts that may be posed to workers, the community, and the environment during construction and operation of the remedy until cleanup levels are achieved.

Alternative 1 would not involve any remedial measures; therefore, no short-term risk to workers, the community, or the environment would exist. The activities associated with Alternatives 2, 3, and 4 would be protective to the surrounding community from short-term risks except for minimal potential

short-term risks during transport (possible accident when soil is transported off site) of perchlorate and explosive contaminated soil.

Alternatives 2, 3, and 4 would involve potential short-term risks to remediation workers associated with exposure to contaminated groundwater from monitoring and/or operation of drilling/construction equipment, and with exposure to contaminated soil during excavation work.

Alternative 2 has additional short-term risks due to remediation workers handling chemical oxidants and also requires heating of the target zone to 40 degrees C, which would pose similar risks as those posed by the thermal treatment included under Alternative 4, such as potential exposure to high voltage power sources. The thermal treatment component of Alternative 4 has additional potential short-term risks due to potential exposure to high voltage power sources and exposure to hot fluids extracted during ISTD treatment. In addition, workers could be exposed to toxic air emissions during ISTD operations.

Alternative 3 would have short-term risks to the remediation workers associated with exposure during increased operations at the LHAAP groundwater treatment system, which include chemical handling and operation of a high-temperature catalytic oxidizer and in handling contaminated groundwater during extraction, temporary storage on site, and conveyance to the GWTP 1.5 miles away. The implementation of Alternative 3 would require more time than either Alternative 2 or Alternative 4.

Alternatives 2, 3, and 4 include the LUCs as elements of their remedies and would provide almost immediate protection from the contaminated groundwater by prohibiting groundwater use except for environmental monitoring and testing through LUC implementation through a relatively quick implementation period. The time period to achieve groundwater cleanup levels is the most significant difference between Alternative 1 versus Alternatives 2, 3, or 4. Alternatives 2 and 3 are expected to take less time to achieve RAOs than Alternative 1, and either Alternative 4a or 4b would require the shortest time for the intermediate zone groundwater to achieve cleanup levels.

2.10.6 Implementability

Implementability addresses the technical and administrative feasibility of a remedy from design through construction and operation. Factors such as availability of services and materials, administrative feasibility, and coordination with other governmental entities are also considered.

Under Alternative 1, no remedial action would be taken. Therefore, no difficulties or uncertainties would be associated with its implementation. For Alternatives 2, 3, and 4, soil excavation would require extensive coordination between excavation, sampling, transportation and disposal. Plugging of the TNT transite wastewater line and cooling water lines can be conducted without extensive intrusive activities with equipment, services, and materials readily available to conduct the activities for Alternatives 2, 3, and 4. Alternatives 2, 3, and 4 could all be implemented. There are qualified vendors available to implement the ISTD technology. There are also qualified contractors with the capabilities to design and implement ISCO. Installation of utilities, availability of equipment and supplies, and compliance with any local ordinances or other requirements would need to be identified and addressed during the design and construction process.

Alternative 3 would involve the use of a groundwater treatment system which currently exists at LHAAP and is accessible to the site; however, from a technical standpoint the increased duration for extraction would require three years for Alternative 3 compared to six months for Alternative 2 and

Alternative 4b, or approximately 3 months for Alternative 4a. The U.S. Army will be responsible for LTM and enforcement of the LUCs, long-term evaluation of MNA, long-term sampling, and LTM and operation of sampling equipment. Technically, Alternatives 2, 3, and 4 are readily implementable.

Administratively, all of the alternatives are implementable.

2.10.7 Cost

Cost estimates are used in the CERCLA process to eliminate those remedial alternatives that are significantly more expensive than competing alternatives without offering commensurate increases in performance or overall protection of human health or the environment. The cost estimates developed are preliminary estimates with an intended accuracy range of –30 to +50 percent. Final costs would depend on actual labor and material costs, actual site conditions, productivity, competitive market conditions, final scope, final schedule, final engineering design, and other variables.

The cost estimates include capital costs (including fixed-price remedial construction) and long-term O&M costs (post-remediation). Overall present worth costs are developed for each alternative assuming a discount rate of 2.8 percent. The duration used for the estimates is a 30-year period.

The progression of present worth costs from the least expensive alternative to the most expensive alternative is as follows: Alternative 1, Alternative 3, Alternative 4a, Alternative 4b, and Alternative 2. No costs are associated with Alternative 1 because no remedial activities would be conducted.

Alternative 3 has the lowest present worth and capital costs of the active remedial alternatives. The presence of the existing groundwater treatment system at LHAAP greatly reduces the capital costs associated with groundwater extraction in Alternative 3. Alternative 2 has the highest present worth and capital costs primarily due to the activities associated with the injection phase of ISCO. Alternative 4a has a lower present worth than Alternative 4b, however the difference in costs between the ISTD process options may reflect differences between the components included in the proposed designs for ERH and TCH developed for the FS. The proposed ERH concept developed for this site and used to develop costs presented in the FS does not include a groundwater extraction component, while the proposed TCH concept incorporated groundwater extraction as part of the MPE component. The TCH conceptual design is significantly more robust than the one proposed for ECH, which may in part explain the difference in total cost between Alternatives 4a and 4b.

2.10.8 State/Support Agency Acceptance

The USEPA and TCEQ have reviewed the Revised Proposed Plan, which presented Alternative 4 as the preferred alternative. Comments received from the USEPA and TCEQ during the Revised Proposed Plan development have been incorporated. Both agencies concur with the selected remedial action.

2.10.9 Community Acceptance

Community acceptance is an important consideration in the final evaluation of the selected remedy. Verbal comments were received during the public meeting held on December 6, 2018 at the Karnack Community Center. No other comments were received during the 30-day public comment period. The topics of the comments included: excavation and disposal of contaminated soils; requirements for vegetation removal and above ground ecological impacts of the remedial actions; the status of

the wooden wastewater line; prior treatability studies; groundwater plume stability and migration; ISTD effectiveness; and regulatory drivers for remediation. Comment responses were provided and incorporated into the ROD, including describing soil sampling and evaluating the wooden wastewater lines for removal.

Several sets of written public comments were received during the 30-day public comment period and public meeting held for the 2011 PP, and there were several verbal comments from the March 22, 2011 public meeting. Although the selected remedy has changed, most of the comments remain relevant. The relevant topics of the 2011 comments included: excavation of contaminated soils, groundwater treatment plant operation, additional groundwater sampling for DNT isomers, remediation for flushing and plugging the subsurface TNT wastewater line, and plugging the cooling water lines. Comment responses were provided and are summarized in the Responsiveness Summary (**Section 3**).

2.11 Principal Threat Waste

Laboratory results from the groundwater at LHAAP-29 have indicated that residual DNAPL may be residing as a source material in the subsurface. In a phase separate from groundwater, the hazardous contaminant MC is characterized as a highly toxic source material and, thus, a principal threat waste. In accordance with the NCP, treatment alternatives have been evaluated through the remedy selection process. The preferred remedial alternative includes an active remedial component that would mitigate the potential principal threat. By instituting an ISTD treatment of the groundwater, this active treatment would be applied to the highest concentration area in the MC groundwater plume and would comply with the NCP expectations regarding treatment of affected media where principal threat may be considered.

2.12 The Selected Remedy

2.12.1 Summary of Rationale for the Selected Remedy

Alternative 4 (Excavation and Off-site Disposal for Soil; Plug Lines; ISTD, MNA and LUCs for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater) is the selected alternative for LHAAP-29 and is consistent with the intended future use of the site as a national wildlife refuge. Either Alternative 4a, using ERH, or Alternative 4b, using TCH as the ISTD process option would be selected during the RD. The ISTD would rapidly reduce MC concentrations in the intermediate zone to make conditions more amenable for MNA. The selected alternative offers a high degree of long-term effectiveness and can be easily and immediately implemented. This alternative would satisfy the RAOs for the site through the following:

- Contaminated soil and sediment removal with off-site disposal to protect the hypothetical future maintenance worker and ecological receptors from exposure and eliminate the soil-to-groundwater pathway. Additional confirmation soil sampling during the RD may identify additional soil excavation areas, see **Section 2.12.2**.
- Flushing, inspecting, and plugging of the transite TNT wastewater line and the vitrified clay cooling water lines to eliminate potential exposure from residual contamination. The wooden wastewater lines would be evaluated during the RD for excavation and disposal.
- For intermediate groundwater zone: ISTD treatment of the MC DNAPL plume to reduce to levels amenable to MNA.

- MNA was selected as one component of the remedy based on available groundwater evidence as presented in the FS (Shaw, 2010). A tiered approach using three lines of evidence was used to examine the occurrence of natural attenuation. The first line of evidence evaluated reductions in COC concentrations over time and with distance, the second line of evidence evaluated geochemical indicators, while the third line of evidence entailed estimation of natural attenuation rates. Historical decreases in concentrations of chlorinated solvents in individual wells were observed in intermediate groundwater, including the detection of daughter products that suggest the occurrence of complete reductive dechlorination. Concentrations of TCE decreased from 8,800 µg/L to 4,340 µg/L at monitoring well 29WW16 and were completely attenuated at monitoring well 29WW35. Concentrations of MC decreased from 8,770 µg/L to undetectable at 29WW35. These results indicated the intermediate contaminant plume is stable. Thus, natural attenuation was considered feasible for intermediate groundwater, but not as a sole remedy due to the high MC concentrations in groundwater at 29WW16 and vicinity. Additional evaluation would be implemented as part of the MNA component. MNA, together with ISTD, would ultimately restore the intermediate groundwater to attain groundwater cleanup levels. This is anticipated to be completed in approximately 5-10 years. Considering the lithologic variability, particularly the lateral and vertical change from sand to clay, the times to achieve the cleanup levels may vary by an order of magnitude. This approximate timeframe to achieve cleanup levels is considered reasonable based on the anticipated future land use of the site as a national wildlife refuge and the fact that there is no current or anticipated future use of groundwater as a drinking water supply. Thus, MNA is an appropriate component of the remedy for the intermediate groundwater because it would protect human health and the environment, and would document that further reductive dechlorination is occurring within the groundwater plume and that contaminant concentrations are being reduced to attain groundwater cleanup levels.
- For shallow groundwater zone: MNA to reduce contaminant levels to cleanup levels and return groundwater to its potential beneficial uses, and confirm the contaminated groundwater remains localized with minimal migration to protect surface water. MNA was selected as the remedy based on available groundwater evidence as presented in the FS (Shaw, 2010). A tiered approach using three lines of evidence was used to examine the occurrence of natural attenuation. The first line of evidence evaluated reductions in COC concentrations over time and with distance, the second line of evidence evaluated geochemical indicators, while the third line of evidence entailed estimation of natural attenuation rates. Historical decreases in concentrations of perchlorate, explosives, and chlorinated solvents in individual wells were observed in shallow groundwater, including the detection of daughter products that suggest the occurrence of complete reductive dechlorination. These results indicated the shallow contaminant plumes are stable, and monitoring wells formerly with COC concentrations above cleanup levels have attained the cleanup levels in the historical sampling record. Noting some of the highest remaining concentrations; perchlorate decreased from 88,000 µg/L to 16,800 µg/L at monitoring well 29WW15, the explosive o-NT decreased from 18,000 µg/L to 1,230 µg/L at monitoring well 29WW05, and the chlorinated solvent 1,2-DCA decreased from 14,000 µg/L to 5,520 µg/L at 29WW15. Thus, natural attenuation was considered feasible for perchlorate, explosives and chlorinated solvents in shallow groundwater. Additional evaluation would be implemented as part of the MNA component. MNA would ultimately restore the shallow groundwater to attain groundwater cleanup levels. This is anticipated to be completed in approximately 70 years

based on attenuation of 1,2-DCA in 29WW15. Considering the lithologic variability, particularly the lateral and vertical change from sand to clay, the times to MCL may vary by an order of magnitude. This approximate timeframe to achieve cleanup levels is considered reasonable based on the anticipated future land use of the site as a national wildlife refuge and the fact that there is no current or anticipated future use of groundwater as a drinking water supply. Thus, MNA is an appropriate component of the remedy for the shallow groundwater because it would protect human health and the environment and would document that further natural attenuation is occurring within the groundwater plume, and that perchlorate, explosives, and chlorinated solvent concentrations are being reduced to attain groundwater cleanup levels.

- The LUC to prohibit groundwater use (except for environmental testing and monitoring) as a potable source would be implemented to ensure protection of human health by preventing exposure to groundwater until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met. The LUC restricting land use to nonresidential would be implemented until it is demonstrated that the surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure. The LUC to maintain the integrity of any current or future remedial or monitoring systems would be implemented until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met.
- Long-term monitoring and reporting would continue until the cleanup levels are achieved in groundwater to confirm protection of human health by preventing exposure to groundwater until cleanup levels are met.

Five-year reviews will be performed to document that the remedy remains protective of human health and the environment.

Based on information currently available, the U.S. Army believes the selected alternative meets the threshold criteria and provides the best balance of tradeoffs among the other alternatives with respect to the CERCLA §121(b) criteria used to evaluate remedial alternatives. The selected alternative: 1) is protective of human health and the environment; 2) complies with ARARs; 3) is cost-effective; 4) utilizes a permanent solution; and 5) utilizes an active treatment as a principal element. The selected remedy addresses the statutory preference for treatment to the maximum extent possible. As a component of the intermediate groundwater zone, MC is characterized as a highly toxic source material and, thus, a principal threat waste. In accordance with the NCP, treatment alternatives have been evaluated through the remedy selection process. The preferred remedial alternative includes an active remedial component that would mitigate the potential principal threat. By instituting ISTD treatment of the groundwater, this active treatment would be applied to the highest concentration area in the MC groundwater plume and would comply with NCP expectations regarding treatment of affected media where principal threat may be considered.

In the remedial design, the U.S. Army would present details of the soil excavation, selected ISTD process (ERH or TCH), ISTD design, LUC operations and maintenance, groundwater monitoring, flushing TNT transite wastewater line and cooling water lines, evaluating the deteriorated wooden wastewater line for excavation and disposal, plugging and abandoning TNT wastewater and cooling water lines, and MNA remedy implementation for LHAAP-29.

2.12.2 Description of the Selected Remedy

The selected remedy, Alternative 4, was outlined in **Section 2.9**; that description is expanded in the following discussion. The major components of the remedy include:

***Soil Excavation*.** The excavation would remove explosives and perchlorate contaminated soils for off-site disposal at a RCRA Subtitle D-permitted landfill. This action would achieve the following: 1) removal of soil that is a direct risk to the hypothetical future maintenance worker, thereby protecting human health by preventing inhalation, ingestion, and dermal contact with the COCs; 2) removal of contaminated soil that is a potential source of contaminant migration to groundwater; and 3) removal of soil posing a risk to ecological receptors. The cleanup levels are presented in **Table 2-10**. The approximate excavation locations are highlighted on **Figure 2-12**. The removal of soil contamination would be verified by collecting confirmation samples from the walls and floors of the excavation area and submitting them for laboratory analysis for the COCs of interest. Clean borrow soil would be used as needed to backfill the excavations so they can be graded for proper drainage. Additional sampling would be required during the remedial design phase to further define explosives impacts near former Building 812-F and in the cooling water outfall/ditch as part of the remedial design, and confirmation soil samples would be collected adjacent to the North and South Cooling Water lines as well as the wooden and transite TNT wastewater lines to confirm that leaching from the lines has not occurred. Results from the confirmation soil sampling may identify additional areas exceeding the cleanup levels presented in **Table 2-10**, which would require soil excavation.

Plug and Abandon Lines. The transite TNT wastewater line and the cooling water lines would be flushed with water to remove solid residue. After flushing, the lines would be visually inspected to evaluate if there is any remaining residue and/or liquid in the lines. The inspection and closure details would be included in the RD and may include techniques such as sampling of flush water and video camera inspection if there is any uncertainty about the effectiveness of the flushing. The rinsate water would be containerized. During typical flushing operations, the flush water would be sampled, analyzed and screened to TCLP (or the equivalent TCEQ test) to determine disposal. The inlets and outlets of the transite TNT wastewater line would be plugged with a bentonite slurry mix or equivalent. The manholes and outlets of the cooling water lines would then be plugged with a bentonite slurry mix or equivalent. The deteriorated wooden wastewater line would be sampled to determine whether contaminants in the line exceed soil cleanup levels and require excavation and disposal.

***In-situ Thermal Desorption for Intermediate Zone VOC Groundwater Plume*.** Under Alternative 4 the highest concentration area in the MC plume in the Intermediate Zone groundwater would be treated using ISTD with either the process option ERH (Alternative 4a) or TCH (Alternative 4b) to be determined during the remedial design phase. Groundwater extraction may be implemented as part of the in-situ treatment to physically remove mass and to control the hydraulic gradient.

ERH delivers electricity through subsurface media via an array of electrodes. The heat generated by electrical resistance typically can raise subsurface temperatures to around the boiling point of water. The steam produced from pore-water serves as a medium to carry out volatilized VOCs for capture via SVE and subsequent ex-situ treatment of extracted vapors. In addition, the applied heat can increase hydrolysis of chlorinated solvents, such as MC, and promote in-situ biological activity in two ways. First, biological activity is boosted by moderately high temperatures (30 ºC) found at the periphery of the heated area during active thermal treatment, and throughout the heated area as it

cools. Second, high temperatures increase the solubility of DNAPL, resulting in an increase in contaminant concentrations in the dissolved form that the microbes are able to use, provided the concentrations of the dissolved COCs are not toxic to the microorganisms.

TCH involves applying heat and vacuum simultaneously to subsurface media with an array of vertical heater/vacuum wells. The wells are typically heated by electrical coils, but can also be heated by fuel (e.g. natural gas or propane) combustion. Heat generated from heating elements/wells is transferred to the subsurface largely through thermal conduction and radiant heating. Similar to ERH, the heat generated by TCH typically raises subsurface temperatures to around the boiling point of groundwater and the steam produced from the groundwater serves as a medium to carry out volatilized VOCs. In addition, the applied heat can increase hydrolysis and promote in-situ biological activity.

Preliminary conceptual designs including the number and spacing of heater wells (TCH) or electrode borings (ERH), associated vapor and/or dual phase extraction systems, and treatment train for extracted vapors and condensate were developed and used for FS costing. The final ISTD process option would be determined during the remedial design phase, and the specific design parameters, including the number and locations of heater wells (TCH) or electrodes (ERH) and associated treatment train components may change as the system design is refined.

The ERH preliminary conceptual design components include:

- ***Electrode borings.*** Fifteen 12-inch diameter electrode borings would be installed to a depth of 91 feet bgs with co-located vapor extraction wells screened above 48 feet bgs; average electrode spacing would be 18 ft. The electrodes would be used to heat the subsurface to near boiling temperatures to volatilize VOCs from the subsurface, and the vapor extraction wells would extract the steam generated.
- ***Temperature monitoring probes.*** Four probes, with 10 sensors per probe to monitor subsurface temperatures.
- ***Vapor treatment.*** Activated carbon or a thermal oxidizer would be used to treat the vapors. The vendor's conceptual design included activated carbon, but the expected mass loading would require a thermal oxidizer to treat the extracted vapor. Airflow rate is estimated at 320 scfm.
- ***Condensate collection.*** Condensate production is estimated at 0.9 gpm and would be captured and stored in aboveground tanks for transfer to the on-site GWTP.
- ***Power control unit.*** A 480 volt, 3-phase 700 kilowatt power control unit would be required to supply the required power to the electrodes, extraction and treatment components associated with the system operations.

Figure 2-14 shows the conceptual layout for the network of ERH electrodes. The final layout and number of electrodes would be determined as part of the RD if ERH is the selected ISTD process option.

The TCH preliminary conceptual design components include:

- ***Heater borings.*** 25 heater borings would be installed to a depth of 91 feet bgs with co-located vapor extraction wells screened at close to the target zone depth. Average electrode spacing would be 18 feet.

- ***Multi-phase extraction wells.*** 7 multi-phase extraction wells would be installed in 10-inch boreholes to extract vapor and water for treatment.
- ***Temperature monitoring probes.*** 5 temperature monitoring probes with 3 sensors in each probe would be instated in 6-inch boreholes to monitor subsurface temperatures.
- ***Vapor treatment.*** Activated carbon or a thermal oxidizer would be used to treat the vapors. The vendor's conceptual design included activated carbon, but the expected mass loading would require a thermal oxidizer to treat the extracted vapor. Airflow rate is estimated at 320 scfm.
- ***Water collection and treatment.*** The water production rate is estimated at 1-3 gpm and would be captured and stored in aboveground tanks for transfer to the GWTP.
- ***Power control unit.*** A 480-volt, 3-phase 700 kilowatt power control unit would be required to supply the required power to the heater borings, extraction and treatment components associated with the system operations.

Figure 2-15 shows the conceptual layout for the network of TCH heater borings. The final layout and number of electrodes would be determined as part of the RD if TCH is the selected ISTD process option.

Major components of the MNA remedy include:

- ***MNA to return groundwater to its potential beneficial use, wherever practicable given the particular circumstances of the site.*** MNA begins following ISTD activities. Historic data suggest that natural attenuation of COCs is occurring at the site; however, additional data collection is necessary to fully evaluate natural attenuation. Monitoring wells would be sampled for eight consecutive quarters to evaluate and confirm the occurrence of natural attenuation in conjunction with historical data. Data from the eight quarterly events would be combined with historic data to evaluate the effectiveness of various natural physical, chemical, and biological processes in reducing contaminant concentrations.
- ***Performance objectives to evaluate the MNA remedy performance after two years.*** Each of the general performance objectives must be met as indicated below. If MNA is effective, a baseline would be established from the data to that point in time. Specific evaluation criteria would be developed in the RD. A contingency remedy would be developed and implemented to enhance MNA if it is found to be ineffective. If the criteria are not met to illustrate that MNA is an effective remedy, the contingency action would be initiated.

  The MNA evaluation would be based on the USEPA lines of evidence (USEPA, 1999) as follows:

  - Plume stability (i.e., the plume concentrations are decreasing in the majority of performance wells, and the plume is not expanding in area as demonstrated with compliance wells)
  - MNA Process Evaluation demonstrated based on an attenuation rate calculated with empirical performance monitoring data, and MNA Process Demonstration based on the presence of daughter products and bacterial culture counts
- ***A contingency remedy to enhance MNA to reach the RAOs if MNA is found to be ineffective.*** The area and the elements of the contingency remedy would be selected based on the entire data set available. The contingency remedy would consist of injection of bioremediation amendments to enhance degradation of the groundwater contaminants at

selected locations based on data available at the time it is determined MNA is not successful. Development and specific description of the contingency remedy would be presented in a RD/RAWP.

- ***Initiate LTM.*** Monitoring would be conducted to evaluate the remedy performance and determine if the plume conditions remain constant, improve or worsen after the baseline is established. LTM would be implemented at a frequency of semiannual for three years, then annually until the next five-year review. The performance monitoring plan would be developed in the RD and would be based on USEPA guidance (USEPA, 2004).
    - Continue LTM annually thereafter until recommended otherwise by the five-year review to evaluate remedy performance and determine if plume conditions remain constant, improve, or worsen. The baseline of the plume for future five-year reviews would be established as part of the MNA evaluation program. The initial LTM plan would be developed in the RD.
    - Groundwater monitoring would be conducted to evaluate inorganic COCs. The need to continue groundwater monitoring for this purpose would be evaluated at five year reviews.
- ***Land Use Control.*** The LUC objectives include maintaining the integrity of any current or future remedial or monitoring systems, and preventing the use of groundwater contaminated above cleanup levels as a potable water source. The groundwater treatment and MNA remedial components include a groundwater monitoring system that will be used to characterize the condition of the groundwater during the period the groundwater remedy is in place until the groundwater remediation goals are achieved, and to demonstrate achievement of the groundwater remediation goals when the groundwater remedy is complete. As a part of this groundwater remedy, the Army will maintain the remedial and monitoring systems associated with the groundwater remedies until these components of the remedy are no longer needed to achieve cleanup levels, and cleanup levels have been achieved. During the period of operation of the groundwater remedy, if any of the elements of the remedial and groundwater monitoring systems are damaged, destroyed, or become ineffective, they will be repaired or replaced with suitable components to assure that the remedial and groundwater monitoring systems are able to provide data of the quality necessary to determine the progress of and eventual completion of this component of the remedy. The actions to be taken to implement these LUC objectives and requirements will be provided through modifying the “Comprehensive Land Use Control (LUC) Management Plan, Former Longhorn Army Ammunition Plant, Karnack, Texas” and detailed in the LUC RD.
    - The LUC for prohibition of groundwater use (except for monitoring and testing) shall be implemented and shall remain in place at the Site until the COCs (i.e. including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater remaining at the site are reduced below levels that would support unlimited use and unrestricted exposure. A LUC RD will be finalized as the land use component of the Remedial Design. Within 21 days of the issuance of the ROD, the Army will propose deadlines for completion of the RD Work Plan, RD and Remedial Action Work Plan. The documents will be prepared and submitted to the EPA and the TCEQ pursuant to the FFA. The LUC RD will contain implementation and maintenance actions, including periodic inspections. The long-term groundwater and surface water monitoring and MNA performance monitoring plan will also be presented in the RD. The recordation notification for the

Site which will be filed with Harrison County, will include a description of the LUCs. The preliminary boundary for the groundwater LUC is shown on **Figure 2-16**.

- The LUC restricting land use to nonresidential shall be implemented until it is demonstrated that surface and subsurface soil and groundwater COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) are at levels that allow for unlimited use and unrestricted exposure.
- The LUC to maintain the integrity of any current or future remedial or monitoring systems will remain in place until the levels of COCs (i.e., including all hazardous substances, pollutants and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in groundwater are met. The LUC to prohibit groundwater use (except for environmental monitoring and testing) as a potable source will remain in place until the levels of COCs (i.e., all hazardous substances, **Table 2-10**) in soil and groundwater allow for unlimited use and unrestricted exposure.

The Army will implement, maintain, monitor, report on and enforce land use controls at Army-owned property. The Army shall perform those actions related to land use control activities described in this ROD and in the Remedial Design for the ROD. For portions of the site subject to land use controls that are not owned by the Army, the Army will monitor and report on the implementation, maintenance, and enforcement of land use controls, and coordinate with federal, state, and local governments and owners and occupants of properties subject to land use controls. The Army will provide notice of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. The Army will send these notices to the federal, state and local governments involved at this site, and the owners and occupants of the properties subject to those use restrictions and land use controls. The Army shall provide the initial notice within 90 days of ROD signature. The frequency of subsequent notifications will be described in the Remedial Design for the ROD. The Army remains responsible for ensuring that the remedy remains protective of human health and the environment. The Army will fulfill its responsibility and obligations under CERCLA and the NCP as it implements, maintains, and reviews the selected remedy.

Upon transfer of Army-owned property, the Army will provide written notice of the land use controls to the transferee of the groundwater and soil (surface and subsurface) contamination and any land use restrictions referenced in the ROD. Within 15 days of transfer, the Army shall provide USEPA and TCEQ with written notice of the division of implementation, maintenance, and enforcement responsibilities unless such information has already been provided in the LUC RD. The LUC RD will address the procedures to be used by the Army and the transferee to document compliance with the LUCs described in this ROD. In the event property is transferred out of Federal control, the land use controls relating to property and groundwater restrictions shall be recorded in the deed and shall be enforceable by the United States and the state of Texas.

LUC implementation and maintenance actions will be described in the RD for LHAAP 29. The LUCs would be included in the property transfer documents and a recordation of them filed in the Harrison County Courthouse. The LUC for groundwater will prevent human exposure to groundwater contaminated with chlorinated solvents, explosives, metals, and perchlorate through the prohibition of groundwater use (except for environmental monitoring and testing), restrict land use to nonresidential, require maintenance of the integrity of any current or future remedial or monitoring systems and prevent the use of groundwater contaminated above cleanup levels as a potable water source. In addition, within 90 days of signature of this ROD, the Army shall request the Texas

Department of Licensing and Regulation to notify well drillers of groundwater use prohibitions based on a preliminary LUC boundary. Within 21 days of the issuance of the ROD, the Army will propose deadlines for completion of the RD Work Plan, RD, and Remedial Action Work Plan. The documents will be prepared and submitted to USEPA and TCEQ pursuant to the FFA. The LUC RD will contain implementation and maintenance actions, including periodic inspections. Consistent with the dates presented for these documents, the Army shall: 1) request the Texas Department of Licensing and Regulation to notify well drillers of the final boundary of groundwater use prohibitions; and 2) notify the Harrison County Courthouse of the LUCs to include a map showing the area of groundwater use prohibition at the site, in accordance with 30 TAC 335.565.

Monitoring activities associated with the LUCs will confirm that groundwater is not being used. Long-term operational requirements under this alternative will include maintenance of the LUCs. Groundwater monitoring will demonstrate no migration of the plume and the eventual reduction of contaminates to levels below cleanup levels. The need for continued groundwater monitoring will be evaluated every 5 years during the reviews. Sampling frequency and analytical requirements will be presented as an appendix to the RD for LHAAP-29.

2.12.3 Cost Estimate of the Selected Remedy

Table 2-12 and **Table 2-13**present the present worth analysis of the cost for the selected remedy, Alternative 4a or 4b. The information in the tables is based on the best available information regarding the anticipated scope of the remedial alternative. The quantities used in the estimates are for estimating purposes only. Changes in the cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. Changes will be documented in accordance with 40 CFR 300.435(c)(2) in the form of a memorandum in the Administrative Record, an Explanation of Significant Difference (ESD), or a ROD amendment, as necessary. This is an order-of-magnitude engineering cost estimate that is expected to be within -30 to +50 percent of the actual project cost.

The total project present worth, capital, and O&M costs for Alternatives 4a and 4b are shown in **Table 2-12** and **Table 2-13**. For Alternative 4a, the capital costs are $3.71M, O&M costs are $1.03M, and total present worth costs are $4,740M. For Alternative 4b, the capital costs are $4.53M, O&M costs are $1.19M, and total present worth costs are $5.72M. The costs were developed using a discount rate of 2.8%. The O&M costs include evaluation of MNA, maintenance of the LUC, and LTM through Year 30. The LTM would support the required CERCLA five-year reviews.

2.12.4 Expected Outcomes of Selected Remedy

The purpose of this response action is to attain the RAOs stated in **Section 2.8** of this document. **Table 2-10** presents the cleanup levels. The cleanup levels for the COCs in the groundwater are the Federal SDWA MCLs, or in the absence of federal drinking water standards, the cleanup level is the TRRP Residential Groundwater PCL. The cleanup level for the soil is the GWP-Ind MSC. The cleanup levels for the COPECs in soil are the EcoPRGs.

The expected outcome of the selected remedy is that contaminants in soil and groundwater will be reduced to the cleanup levels. Achievement of the cleanup levels (**Table 2-10**) is anticipated to be completed in approximately 70 years based on the MNA for 1,2-DCA in the shallow zone. MNA in the intermediate zone is estimated to take 5-10 years following active treatment of the DNAPL plume. Considering the lithologic variability, particularly the lateral and vertical change from sand to clay, the times to achieve the cleanup levels may vary by an order of magnitude. This approximate

timeframe to achieve cleanup levels is considered reasonable for the anticipated future land use as a national wildlife refuge.

The LUC for the maintenance of the monitoring system will be maintained until the groundwater cleanup levels are achieved. The LUCs for soil and groundwater will be maintained until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) allow for unlimited use and unrestricted exposure. In the short-term (prior to the groundwater achieving cleanup levels), the site will be made part of a national wildlife refuge operated by USFWS, and will continue as such in the long-term (after the groundwater achieves cleanup levels).

In addition, the monitoring activities associated with MNA will confirm the protection of human health and the environment by documenting the return of the groundwater to its potential beneficial use as a drinking water supply, by documenting reduction of the contaminant mass, and protection of surface water through containment of the plume. The LUC for groundwater will prohibit the use of the site's groundwater except for environmental monitoring and testing.

As part of the evaluation of MNA, attenuation rates are computed and evaluated in accordance with the USEPA guidance material (USEPA, 1998). Time-dependent attenuation rate constants and estimated in-well cleanup times are determined based on COC concentration data over time from individual wells assuming first order degradation kinetics. Attenuation rates are calculated for the monitoring wells with the highest concentrations for which the available data allow such a calculation. Attenuation rates are based on the following formula from the USEPA guidance (USEPA, 1998):

$C = C_o e^{-kt}$

where: C = concentration at time t
C_o = initial concentration
k = attenuation rate constant (first order reaction)

2.13 Statutory Determinations

Under CERCLA §121 and the NCP, the U.S. Army must select remedies that are protective of human health and the environment, comply with ARARs (unless a statutory waiver is justified), are cost effective, and utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable. In addition, CERCLA includes a preference for remedies that employ treatment that permanently and significantly reduce the volume, toxicity, or mobility of hazardous wastes as a principal element and a bias against off-site disposal of untreated wastes. The following sections discuss how the selected remedy meets the statutory requirements.

2.13.1 Protection of Human Health and the Environment

The selected remedy, Alternative 4, will achieve the RAOs for LHAAP-29. For the protection of human health, the remedial action would remove soil that exceeds the cleanup levels; flush and remove residues from the process lines and properly dispose the rinsate; reduce groundwater COCs with ISTD in the intermediate zone followed by MNA; reduce shallow groundwater COCs with MNA, which would eventually achieve the destruction of the COCs present in the groundwater plumes at

LHAAP-29. Continued maintenance of the LUC for groundwater will prevent human access and exposure to groundwater that poses an unacceptable risk to human health, until COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soils and groundwater, have sufficiently degraded to levels that allow for unlimited use and unrestricted exposure. At LHAAP-29 the evaluation of historical groundwater contaminant trends indicates that natural attenuation processes are occurring at the site. This remedy provides adequate confirmation that human health and the environment are protected because monitoring would be conducted to document the effectiveness of MNA. The monitoring activities associated with MNA will ensure that COCs and by-product (daughter) contaminants in groundwater do not flow to surface water bodies at such levels that ARARs are exceeded. There are currently no surface water impacts identified. The LUCs for soil and groundwater will be maintained until the levels of COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) in soil and groundwater allow for unlimited use and unrestricted exposure.

For the protection of ecological receptors, the remedial action would remove soil at select areas (in addition to those areas excavated for the protection of human health) to address ecological risks. The outcome of the removal is that the soil in the Industrial Sub-Area, which includes LHAAP-29, will satisfy the EcoPRGs.

There are no short-term threats associated with the selected remedy that cannot be readily controlled. In addition, no adverse cross-media impacts are expected from the selected remedy.

2.13.2 Compliance with ARARS

The selected remedy complies with all ARARs. The ARARs are presented below and in **Table 2-14**.

Chemical-Specific ARARs

- **Soil**: There are no federally promulgated chemical-specific ARARs for soil. The State of Texas promulgated cleanup standards under 30 TAC 335, Subchapter S, specifically 30 TAC 335.559 (g)(2) which specifies contaminant concentration limits for nonresidential soil and are used as the chemical-specific ARARs for the site soils. The concentrations represent the non-residential soil-to-groundwater cross-media protection concentrations that must be met to demonstrate that a contaminant in soil does not pose the potential for a future release of leachate in excess of the groundwater concentration considered to be protective for nonresidential worker exposure. It is anticipated that removal of contaminated soils above the Texas standards will prevent further contamination of the groundwater from soil at the site.
- **TNT Wastewater Line and Cooling Water Lines**: The removal of explosive-contaminated solid or liquid residue remaining in the line by flushing and disposing of the rinsate based on TCLP criteria or equivalent TCEQ criteria will prevent any further contamination of the groundwater from any explosive-contaminated residue remaining in the lines, in accordance with 40 C.F.R. § 261.2 and 30 TAC 335.559(g)(2).
- **Surface water**: Section 121(d)(2) of CERCLA states that every remedial action shall require a level of control which at least attains surface water quality criteria established under Sections 304 or 303 of the Clean Water Act of 1972 (CWA) where such goals and criteria are relevant and appropriate under the circumstances of the release or threatened release. Therefore, surface water quality criteria may be ARARs if there is a remedial action that

affects surface water, and measures will be implemented during construction to prevent off-site migration of contaminants to surface waters. In the event of remedy failure resulting in or potentially resulting in a release to surface water, 40 C.F.R. §§ 122, 125, 129, and 130-131, 40 C.F.R. §§ 141.61 and 141.62, and 30 TAC 307.4, 307.6, 307.7, 307.8 and 307.9 are considered potential future ARARs.

- **Groundwater**: Cleanup levels are presented in **Table 2-10**. The cleanup goal for groundwater will be the SDWA MCLs as specified in 40 C.F.R. §§ 141.61 and 141.62, which meet health-based standards and criteria. In the absence of federal drinking water standards, clean-up levels will be based on TRRP Residential Groundwater PCLs.

  This alternative will return the contaminated shallow and intermediate groundwater zones at LHAAP-29 to their potential beneficial use as drinking water, wherever practicable, which for the purposes of this ROD is considered to be attainment of the relevant and appropriate SDWA MCLs, and consistent with 40 C. F. R. § 300.430(e)(2)(i)(B&C). If a return to potential beneficial uses is not practicable, this alternative would still meet the NCP expectation to prevent further migration of the plume, prevent exposure to the contaminated groundwater, and evaluate further risk reduction.

Location-Specific ARARs

There are no location-specific ARARs**.**

Action-Specific ARARs

The selected remedy has potential action-specific ARARs related to the following activities: site preparation, construction, and excavation activities; waste generation, characterization, management, storage, and disposal activities; well construction and abandonment; and water treatment.

- **Site Preparation, Construction, and Excavation Activities:** Certain on-site preparation, construction, and/or excavation activities will be necessary under all remediation actions to prepare the site for remediation, including the soil-moving or site-grading activities. Control of fugitive emissions and storm water runoff during implementation of these activities will be required. Airborne particulate matter resulting from construction or excavation activities is subject to the fugitive dust and opacity limits listed in 30 TAC 111, Subchapter A. No person may cause, suffer, allow, or permit visible emissions from any source to exceed an opacity of 30 percent for any 6-minute period (30 TAC 111.111[a]). Reasonable precautions must also be taken to achieve maximum control of dust to the extent practicable, including the application of water or suitable chemicals or the complete covering of materials (30 TAC 111.143 and 30 TAC 111.145). Texas has also promulgated general nuisance rules for air contaminants mandating that no person shall discharge from any source whatsoever one or more air contaminants, or combinations thereof, in such concentration and of such duration as are or may tend to be injurious to or to adversely affect human health or welfare, animal life, vegetation, or property, or as to interfere with the normal use and enjoyment of animal life, vegetation, or property (30 TAC 101.4). Storm water discharges from construction activities that disturb equal to or greater than one acre of land must comply with the substantive requirements of a USEPA National Pollutant Discharge Elimination System (NPDES) general permit (40 C.F.R. § 122. 26), depending on the amount of acreage disturbed. Substantive requirements include implementation of good construction

management techniques; phasing of large construction projects; minimal clearing; and sediment, erosion, structural, and vegetative controls to mitigate runoff and ensure that discharges meet required parameters.

- **Waste and Disposal Activities:** The processes of monitoring, intercepting, or treating contaminated groundwater may generate a variety of primary and secondary waste streams (e.g., soil, personal protective equipment, and dewatering and decontamination fluids). These waste streams are expected to be non-hazardous waste. All solid waste (defined as any solid, liquid, semisolid, or contained gaseous material intended for discard [40 C.F.R. § 261.2]) generated during remedial activities must be appropriately characterized to determine whether it contains RCRA hazardous waste (40 C.F.R. § 262.11; 30 TAC 335.62; 30 TAC 335.503[a][4]; 30 TAC 335.504). All wastes must be managed, stored, treated (if necessary), and disposed in accordance with the ARARs for waste management listed in **Table 2-14** for the particular type of waste stream or contaminants in the waste.
- **Well Construction:** The remedial action may involve the placement, use, or eventual plugging and abandonment of some type of groundwater monitoring, injection, and/or extraction wells, either for in-situ treatment or extraction of the contaminated groundwater or for LTM of the groundwater. Available standards for well construction and plugging/abandonment would provide ARARs for such actions and include 30 TAC 331, Subchapters A and H. Specific provisions 30 TAC §331.9(a); 30 TAC §331.10(a); 30 TAC §331.10(d); 30 TAC §331.21; 30 TAC §331.132(a); 30 TAC §331.132(c); 30 TAC §331.132(d)(1); 30 TAC §331.132(d)(4); 30 TAC §331.133(e) apply. Texas has promulgated technical requirements in Chapter 76 of Title 16 of the TAC applicable to construction, operation, and plugging/abandonment of water wells. In particular, 16 TAC 76.1000 (*Locations and Standards of Completion for Wells*), 16 TAC 76.1002 (*Standards for Wells Producing Undesirable Water or Constituents*) (LHAAP-29 contaminated groundwater could be considered “undesirable water” defined pursuant to Section 76.10[36] as “water that is injurious to human health and the environment or water that can cause pollution to land or other waters”), 16 TAC 76.1004 (*Standards for Capping and Plugging of Wells and Plugging Wells that Penetrate Undesirable Water or Constituent Zones*), and 16 TAC 76.1008 (*Pump Installation*) may provide ARARs for the placement, construction, and eventual plugging/abandonment of groundwater injection or extraction wells or the placement and long-term operation of groundwater monitoring wells for proposed groundwater remedial strategies.
- **Water treatment:** Contaminated groundwater and wastewaters collected during well drilling or decontamination activities could be transported to the groundwater treatment plant at LHAAP-18/24 for processing, and would subsequently be discharged in compliance with the effluent limits for that plant. Such waters would be characterized, as required, before transport and managed accordingly in compliance with requirements for the type of waste contaminating the water. To assure compliance with the groundwater treatment plant’s discharge limits, the incoming water must meet the waste acceptance criteria for the facility. On-site wastewater treatment units (as defined in 40 C.F.R. § 260.10) that are part of a wastewater treatment facility that is subject to regulation under Section 402 or Section 307(b) of the Clean Water Act of 1972 are not subject to RCRA Subtitle C hazardous waste management standards (40 C.F.R. § 270.1(c)(2)(v) and 40 C.F.R. § 264.1(g)(6).; 30 TAC 335.42[d][1]). The USEPA has clarified that this exemption applies to all tanks, conveyance

systems, and ancillary equipment, including piping and transfer trucks, associated with the wastewater treatment unit (Federal Register Title 53, 34079, September 2, 1988).

2.13.3 Cost-Effectiveness

Table 2-12 and **Table 2-13** present the present worth analysis of the cost estimates for the selected remedy. The information in the tables is based on the best available information regarding the anticipated scope of the remedial alternative. The quantities used in the estimates are for estimating purposes only. Changes in the cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. The least expensive alternative to the most expensive alternative (provided no contingencies are implemented) is as

follows: Alternative 1, Alternative 3, Alternative 4a, Alternative 4b, and Alternative 2. No costs are associated with Alternative 1 because no remedial activities would be conducted. Alternative 3 has the lowest present worth and capital costs of the remediation alternatives (Alternatives 2, 3, 4a, and 4b). The present worth cost for Alternative 3 is lower than that of Alternative 2, as it does not involve chemical treatment or construction costs for a groundwater extraction system. However, costs for operation and maintenance are higher for Alternative 3 than that of Alternative 2. Alternative 3 also estimates assume a 3-year duration for extraction; however, the presence of inferred DNAPL and sorbed MC is expected to require extraction for a longer period of time.

Additionally, although Alternative 3 appears to have lower costs than Alternatives 4a or 4b, this ignores that Alternative 3 will take longer to meet the RAOs in the intermediate zone due to the presence of DNAPL and would instead rely on the MNA component and LUCs to protect human health and the environment. Similarly, Alternative 2 is estimated to have the highest cost and has higher uncertainty of ISCO performance in full-scale application compared to bench-scale testing. Since the DNAPL in the intermediate zone may persist longer, MNA and LUCs may need to remain in place longer as well under Alternatives 2 and 3 than under Alternative 4. A comparison between the sub-alternatives 4a (ERH) and 4b (TCH) for treatment of the MC plume in intermediate zone indicates that sub-alternative 4a may have a lower cost; however, the TCH conceptual design under Alternative 4b appears to be more robust.

2.13.4 Utilization of Permanent Solutions and Alternative Treatment (or Resource Recovery) Technologies to the Maximum Extent Practicable

The U.S. Army has determined that the selected remedy represents the maximum extent to which permanent solutions and treatment technologies can be utilized in a practicable manner at the site. Soil excavation would remove impacted soils and groundwater extraction and in-situ treatment would irreversibly reduce groundwater contaminant concentrations in the treated portions of the groundwater plume. Removal of contaminated pipeline solid residue would protect the groundwater from contaminant leaching, and MNA will reduce groundwater contaminants to cleanup levels.

The selected remedy would provide reduction in toxicity, mobility, and volume of the groundwater contaminants via active treatment of the most contaminated areas. The selected remedy would document effectiveness through the confirmation of MNA and the routine monitoring of the attenuation and migration of the contaminants in groundwater.

The selected remedy would provide immediate protection because the LUCs would be implemented quickly. Maintenance of this control would be required until COCs (i.e., including all hazardous substances, pollutants, and contaminants found at the Site at cleanup levels as listed in **Table 2-10**) and by-product (daughter) contaminant concentrations in soil and groundwater that allow for unlimited use and unrestricted exposure.

2.13.5 Preference for Treatment as a Principal Element

The selected remedy would reduce the toxicity, mobility, or volume of contaminants in the groundwater through an active remedial process. By utilizing ISTD as a significant portion of the remedy, the statutory preference for remedies that employ treatment as a principal element is satisfied. In addition, there is a potential principal source threat at LHAAP-29 residing as residual source material in the subsurface. As a component of this groundwater, the hazardous contaminant MC is characterized as a highly toxic source material and, thus, potentially a principal threat waste.

2.13.6 Five-Year Review Requirements

Section 121(c) of CERCLA and NCP 40 C.F.R. § 300.430(f)(5)(iii)(C) provide the statutory and legal bases for conducting five-year reviews. Because this remedy will result in contaminants that remain on site above levels that allow unlimited use and unrestricted exposure, a review will be conducted at least every five years to confirm that the remedy continues to provide adequate protection of human health and the environment.

2.14 Significant Changes from the Proposed Plan

The Revised Proposed Plan was issued for public comments on November 21, 2018 and identified Alternative 4 as the Preferred Alternative, with either Alternative 4a or 4b to be selected during the RD. The U.S. Army reviewed all verbal comments that were discussed during the public meeting (there were no written comments). After careful consideration of the comments, it was determined that no significant changes to the remedy, as originally identified in the Proposed Plan, were necessary or appropriate.

Table 2-1. Summary of Chemicals of Potential Concern and Medium-Specific Exposure Point Concentrations

Scenario Timeframe: Current
Medium: Groundwater
Exposure Medium: Groundwater

Exposure Point	Chemical	Concentration Detected[1] (mg/L)		Frequency of Detection	Exposure Point Concentration (mg/L)	Statistical Measure
		Minimum	Maximum

	Metals					
	Antimony	1.2	2.5	15/65	1.92E+00	95% UCL
	Mercury	0.12	0.22	3/75	2.20E-01	maximum
	Non-Metallic Anion					
	Perchlorate	2.45E-02	7.03E-02	5/6	7.03E-02	maximum

Notes:
[1] Minimum/maximum detected concentration above the reporting limit

For groundwater, the maximum detected concentrations were used to estimate the exposure point concentration.
For soil, the 95% UCL values were used to estimate the exposure point concentration if the concentration exceeded the average and was below the maximum detected; otherwise, the maximum detected concentration was used to estimate the exposure point concentration.

---: No information available
95% UCL: 95% upper confidence level of the mean
mg/kg: milligrams per kilogram
mg/L: milligrams per liter
TCDD: tetrachlorodibenzo-p-dioxin
TEC: toxicity equivalence concentration

Summary of Chemicals of Potential Concern and Medium-Specific Exposure Point Concentrations:
The table presents the chemicals of potential concern (COPCs) and exposure point concentration (EPC) for each (i.e. the concentration used to estimate the exposure and risk from each COPC). The table includes the range of concentrations detected for each COPC, as well as the frequency of detection (i.e., the number of times the chemical was detected in the samples collected at the site), the EPC, and the statistical measure upon which the EPC was based. The COPCs listed are the ones that were quantitatively evaluated for carcinogenic risk and non-carcinogenic hazard in the Baseline Human Health Risk Assessment (Jacobs, 2002).

Table 2-2. Carcinogenic Toxicity Data Summary

Pathway: Ingestion, Dermal Contact

Chemical of Concern	Oral Cancer Slope Factor $(mg/kg\text{-}day)^{-1}$	Dermal Cancer Slope Factor $(mg/kg\text{-}day)^{-1}$	Weight of Evidence/ Carcinogen Guideline Description	Source/ Date

Table 2-2. Carcinogenic Toxicity Data Summary (continued)

Pathway: Inhalation

Chemical of Concern	Unit Risk Factor $(mg/m^3)^{-1}$	Weight of Evidence/ Carcinogen Guideline Description	Source/Date
Volatile Organics (continued)			
Trichloroethene	1.70E-03	B2	TCEQ, 2001

Notes:
--- : No information available
mg/kg-day: milligrams per kilogram per day
mg/m^3: milligrams per cubic meter
NC: Chemical not classified as a carcinogen
NTV: no toxicity value available
TCDD: tetrachlorodibenzo-p-dioxin
TEC: toxicity equivalence concentration

Weight of Evidence/Carcinogen Guideline Description:
A - Human carcinogen
B1 - Probable human carcinogen – Indicates that limited human data are available
B2 - Probable human carcinogen – Indicates sufficient evidence in animals and inadequate or no evidence in humans
C - Possible human carcinogen
D - Not classifiable as a human carcinogen

Summary of Toxicity Assessment:
The table provides carcinogenic risk information which is relevant to the contaminants of potential concern in soil and ground water. The list of chemicals of concern presented here are the ones that were quantitatively evaluated for carcinogenic risk and non-carcinogenic hazard in the Baseline Human Health Risk Assessment (Jacobs, 2002).

Summary of Toxicity Assessment:
This table provides non-carcinogenic risk information relevant to the contaminants of concern in both soil and ground water. The list of chemicals of potential concern presented here are the ones that were quantitatively evaluated for carcinogenic risk and non-carcinogenic hazard in the Baseline Human Health Risk Assessment (Jacobs, 2002). The uncertainty factor and modifying factor are used in the development of a references dose. The uncertainty factor adjusts results from dose-response studies in animals to make them applicable to humans. The modifying factor is used to account for uncertainties in the available toxicity data from which the reference dose is derived. In the risk assessment, the reference doses and concentrations were for the chronic case, to be conservative.

Summary of Risk Characterization:

The table provides risk estimates for the significant routes of exposure at LHAAP-29. These risk estimates are based on a reasonable maximum exposure and were developed by taking into account various conservative assumptions about the frequency and duration of a hypothetical future maintenance worker's exposure to soil and groundwater, as well as the toxicity of the chemicals of concern. The total risk from exposure to contaminated soil and groundwater at this site is estimated to be 3.9×10^{-01}. A risk below 1×10^{-4} is generally considered to be acceptable (USEPA, 1989). The total groundwater risk is unacceptable.

U.S. Environmental Protection Agency (USEPA), 1989, *Risk Assessment Guidance for Superfund, Vol. I: Human Health Evaluation Manual, (Part A)*, EPA/540/1-89/002, December.

Summary of Risk Characterization:

The table provides hazard quotients (HQs) for each route of exposure and the hazard index (sum of hazard quotients) for all routes of exposure for LHAAP-29. The Risk Assessment Guidance for Superfund (USEPA, 1989) states that, generally, a hazard index (HI) greater than 1 indicates the potential for adverse non-carcinogenic effects. The estimated HI for groundwater is 3.0E+03 and for soil is 1. Both values are unacceptable and indicate that the potential for adverse non-carcinogenic effects could occur from exposure to contaminants in those mediums.

Table 2-6. Chemicals Contributing to Carcinogenic Risk in Groundwater

Chemical	Baseline Risk Assessment			Data Since Risk Assessment			Comparison Levels		Retained as COC ?
	Cancer Risk Groundwater [a]	EPC (µg/L)	Well	Maximum (µg/L)	Well	Adjusted Risk	MCL (µg/L)	TRRP Tier 1 Residential Groundwater PCLs (µg/L)	
Methylene chloride	3.6×10^{-1}	6,600,000	29WW16	10,300,000	29WW16	5.6×10^{-1}	5	5	Yes, 1
1,2-Dichloroethane	2.9×10^{-2}	14,000	29WW15	<12,500	29WW16	--	5	5	Yes, 1
2,4-Dinitrotoluene	1.3×10^{-3}	530	29WW20	50.9 32.4	29WW05 29WW20	1.2×10^{-4}	--	1.3	Yes, 2

Notes and Abbreviations:

1. Identified as COC because most recent maximum concentration is above the Safe Drinking Water Act (SDWA) MCL.
2. Identified as COC because carcinogenic risk is $>10^{-4}$.
3. Excluded because detections are isolated.
4. Excluded because EPC is below the SDWA MCL.
5. Identified as a COC subject to further verification.

[a] From Baseline Risk Assessment Table C-71 (Jacobs, 2002)

[b] SDWA MCL for total trihalomethanes was used for chloroform.

µg/L micrograms per liter
COC contaminant of concern
EPC exposure point concentration
MCL Safe Drinking Water Act maximum contaminant level
NR not resampled for this constituent since Baseline Risk Assessment

Table 2-7. Chemicals with Hazard Quotient Greater than 0.1 in Groundwater

Chemical	Baseline Risk Assessment			Data Since Risk Assessment			Comparison Levels		Retained as COC ?
	Hazard Quotient Groundwater [a]	EPC [a] (µg/L)	Well	Maximum (µg/L)	Well	Adjusted Hazard Quotient	MCL (µg/L)	TRRP Tier 1 Residential Groundwater PCLs (µg/L)

Cadmium	0.12	6.23	119	1.2 1.12	115 116	< 0.1 < 0.1	5		No.6

Notes and Abbreviations:

1. Identified as COC because EPC is above the Safe Drinking Water Act (SDWA) MCL or TRRP Tier 1 Residential Groundwater PCL
2. Identified as COC because HQ is > 1.0
3. Excluded because EPC is below the SDWA MCL
4. Excluded because EPC is below the 95% UTL value for Manganese of 7,820 *µg/L from Final Evaluation of Perimeter Well Data for Use as Groundwater Background (Shaw, 2007)* and HQ is <1.0.
5. Already identified as a COC due to carcinogenic risk (**Table 2-2**)
6. More recent sample results indicate lower concentrations of chemical, reducing HQ to <1.0
7. More recent sample results indicate lower concentrations of chemical below the MCL
8. Excluded because EPC and/or most recent maximum is below the TRRP Tier 1 Residential Groundwater PCL and HQ is <1.0
9. Identified as a COC subject to further verification.

[a] From Baseline Risk Assessment Table C-68 (Jacobs, 2002)
[b] SDWA MCL for total trihalomethanes was used for chloroform
[c] Well with maximum in Baseline Risk Assessment was dry in most recent sampling event and the identified well has the most recent maximum

µg/L	micrograms per liter
COC	contaminant of concern
EPC	exposure point concentration
HQ	hazard quotient
J	estimated; the analyte was positively identified; the concentration is estimated
MCL	Safe Drinking Water Act maximum contaminant level
ND	not detected in associated media or not selected as a chemical of potential concern
NR	chemical not resampled in most recent sampling event

Table 2-8. Chemicals with Hazard Quotient Greater than 0.1 in Soil

Chemical	Baseline Risk Assessment			Data Through 2008			Retained as COC ?
	Soil Hazard Quotient [a]	EPC (mg/kg)	Soil Sample Location	Adjusted Hazard Quotient [b]	Maximum (mg/kg)	Soil Sample Location	
2,4,6-Trinitrotoluene	0.77	190	29SD13	105	26,000	29SD46	Yes, 2
2-Amino-4,6-dinitrotoluene	0.33	25	29SD13	0.63	48	29SD46	No, 1
4-Amino-2,6-dinitrotoluene	0.21	16	29SD13	0.21	16	29SD13	No, 1
2,4-Dinitrotoluene	0.0053	6.2	29SB15	6.8	8,000	29SD46	Yes, 3
Perchlorate [c]	8.1×10^{-5}	0.0703	Max from BHHRA Table 3-66	0.0099	8.6	29SB86	Yes, 4

Notes and Abbreviations:

1. Not identified as contaminant of concern (COC) because HQ is less than 1.0.
2. Identified as COC because risk assessment HQ is almost 1 and most recent sample concentration is greater than the SAI-Ind GWP-Ind.
3. Identified as COC because EPC is above the SAI-Ind and GWP-Ind values and Hazard Quotient is greater than 1.0.
4. Identified as COC because contaminant is COC in groundwater and exceeds the GWP-Ind.

[a] HQ from Baseline Risk Assessment Table C-68 (Jacobs, 2002)
[b] calculated HQ based on the most recent maximum concentration.
[c] Even though HI <0.1, listed because recent maximum concentration is greater than EPC

BHHRA	Baseline Human Health Risk Assessment
EPC	Exposure Point Concentration from Baseline Risk Assessment (Jacobs, 2002)
GWP-Ind	Soil medium-specific concentration for industrial use based on groundwater protection
HQ	hazard quotient
mg/kg	milligrams per kilogram.
SAI-Ind	Soil medium-specific concentration for industrial use based on inhalation, ingestion, and dermal contact

Table 2-11. Comparative Analysis of Alternatives

Criteria	Alternative 1 No Action	Alternative 2 Excavation and off-site disposal for soil; plug lines; in situ chemical oxidation, MNA and LUCs for intermediate zone groundwater; and MNA and LUCs for shallow zone groundwater	Alternative 3 Excavation and off-site disposal for soil; plug lines; groundwater extraction, MNA and LUCs for groundwater	Alternative 4a Excavation and Offsite Disposal for Soil; Plug Lines; Electrical Resistance Heating (ERH) , MNA and LUCs for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater	Alternative 4b Excavation and Offsite Disposal for Soil; Plug Lines; Thermal Conduction Heating (TCH) and MNA for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater
Overall protection of human health and the environment	No protection. Does not achieve RAOs.	Achieves RAOs. Protection of human health and environment provided by soil removal and remediation of groundwater COCs to cleanup levels	Achieves RAOs. Protection of human health and environment provided by soil removal and remediation of groundwater COCs to cleanup levels.	Achieves RAOs in shallow soil/sediment, shallow zone groundwater and intermediate zone groundwater. LUCs can be removed upon completion of active treatment and post-treatment MNA.	Achieves RAOs in shallow soil/sediment, shallow zone groundwater and intermediate zone groundwater. LUCs can be removed upon completion of active treatment and post-treatment MNA.
Compliance with ARARs	No compliance with chemical-specific ARARs.	Complies with all ARARs.	Complies with all ARARs.	Complies with all ARARs.	Complies with all ARARs.

Criteria	Alternative 1 No Action	Alternative 2 Excavation and off-site disposal for soil; plug lines; in situ chemical oxidation, MNA and LUCs for intermediate zone groundwater; and MNA and LUCs for shallow zone groundwater	Alternative 3 Excavation and off-site disposal for soil; plug lines; groundwater extraction, MNA and LUCs for groundwater	Alternative 4a Excavation and Offsite Disposal for Soil; Plug Lines; Electrical Resistance Heating (ERH) , MNA and LUCs for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater	Alternative 4b Excavation and Offsite Disposal for Soil; Plug Lines; Thermal Conduction Heating (TCH) and MNA for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater
Long-term effectiveness and permanence	Is not effective at protection of human health and the environment and does not provide permanence.	Soil removal is a permanent remedy for shallow soil. Excavation of soil is effective long-term and permanent as contamination would be removed from the site and placed in a permitted landfill. In situ chem-ox for intermediate zone should be effective and permanent; however, uncertainty exists concerning the effectiveness of in situ treatment for reducing groundwater contaminant concentrations to cleanup levels. Treatability and pilot studies would be required to further assess the effectiveness of this treatment method and a pre-design would be required to determine the optimum extraction technique configuration. Evaluation of natural attenuation suggests that contaminants are degrading naturally. MNA sampling would be conducted to confirm its effectiveness. Flushing and plugging the process lines would effectively remove any remaining contaminants and there would be no remaining potential for release to surrounding soils. Land use controls would be effective and reliable so long as they are maintained.	Soil removal is a permanent remedy for shallow soil. Excavation of soil is effective long-term and permanent as contamination would be removed from the site and placed in a permitted landfill. Groundwater extraction should be effective and permanent for intermediate zone, based on the efficiency exhibited by the current groundwater treatment system. A pre-design study would be required to determine the optimum extraction technique/configuration. Evaluation of natural attenuation suggests that contaminants are degrading naturally. MNA sampling would be conducted to confirm its effectiveness. Flushing and plugging the process lines would effectively remove any remaining contaminants and there would be no remaining potential for release to surrounding soils. Land use controls would be effective and reliable so long as they are maintained.	Soil removal is a permanent remedy for shallow soil. Excavation of soil is effective long-term and permanent as contamination would be removed from the site and placed in a permitted landfill. MNA has been demonstrated to be effective in managing residual contamination in shallow zone groundwater. ERH is expected to be effective on DNAPL in intermediate zone, MNA demonstrated to be effective in reducing concentrations in intermediate zone groundwater outside of DNAPL zone. Flushing and plugging the process lines would effectively remove any remaining contaminants and there would be no remaining potential for release to surrounding soils. LUCs would remain in place until MNA is completed.	Soil removal is a permanent remedy for shallow soil. Excavation of soil is effective long-term and permanent as contamination would be removed from the site and placed in a permitted landfill. MNA has been demonstrated to be effective in managing residual contamination in shallow zone groundwater. Table 2-11. Comparative Analysis of Alternatives (continued)

Criteria	Alternative 1 No Action	Alternative 2 Excavation and off-site disposal for soil; plug lines; in situ chemical oxidation, MNA and LUCs for intermediate zone groundwater; and MNA and LUCs for shallow zone groundwater	Alternative 3 Excavation and off-site disposal for soil; plug lines; groundwater extraction, MNA and LUCs for groundwater	Alternative 4a Excavation and Offsite Disposal for Soil; Plug Lines; Electrical Resistance Heating (ERH) , MNA and LUCs for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater	Alternative 4b Excavation and Offsite Disposal for Soil; Plug Lines; Thermal Conduction Heating (TCH) and MNA for Intermediate Zone Groundwater; MNA and LUCs for Shallow Zone Groundwater
Reduction of toxicity, mobility, or volume through treatment	No reduction.	Provides permanent and irreversible reduction of intermediate zone. Provides active reduction of toxicity and volume of groundwater contaminants through biological degradation component of MNA.	Extraction and treatment of contaminated groundwater intermediate zone reduces toxicity, mobility, and volume of groundwater contaminants in this area outside of natural processes. Provides active reduction of toxicity and volume of groundwater contaminants through biological degradation component of MNA.	Reduced toxicity, mobility, and volume through excavation, in situ hydrolysis of DNAPL and DNAPL removal followed by ex-situ destruction, and MNA.	Reduced toxicity, mobility, and volume through excavation, in situ hydrolysis of DNAPL and DNAPL removal followed by ex-situ destruction, and MNA.
Short-term effectiveness	No short-term impacts.	Greater potential for impacts to the community or hypothetical future maintenance worker through off-site transportation of contaminated soil. Release to environment can be controlled during construction.	Greater potential for impacts to the community or hypothetical future maintenance worker through off-site transportation of contaminated soil. Release to environment can be controlled during construction.	Greater potential for impacts to the community or LHAAP workers through off-site transportation of excavated soil. Release to environment can be controlled during construction. Potential for impacts to workers from exposure to hot fluids and high voltage power during ERH application. Duration of MNA and LUCs expected to be 5-10 years following active remediation.	Greater potential for impacts to the community or LHAAP workers through off-site transportation of excavated soil. Release to environment can be controlled during construction. Potential for impacts to workers from exposure to hot fluids during TCH application. Duration of MNA and LUCs expected to be 5-10 years following active remediation.
Implementability	Inherently implementable.	Implementable, but uncertainty exists whether in situ chemical oxidation would lower contaminant concentrations to cleanup levels. Specialized knowledge required for implementation. Use of on-site storage tanks may limit storage capacity. A groundwater treatment system is already operating at LHAAP.	Implementable. Use of on-site storage tanks may limit storage capacity. A groundwater treatment system is already operating at LHAAP. Potential exists for limited groundwater recovery which may affect ability of system to remove contaminants to cleanup levels. A pre-design study would be required.	Soil excavation readily implemented with standard Earthmoving equipment. ERH has been proven to be effective on DNAPL and within low hydraulic conductivity zones.	Soil excavation readily implemented with standard Earthmoving equipment. TCH has been proven to be effective on DNAPL and within low hydraulic conductivity zones.

Major assumptions are as described below. Quantities and assumptions are for cost estimating purposes only.

Capital costs include: excavation evaluation, excavation and disposal activities, flow tests, engineering support, and construction management. The soil is assumed to be classified as nonhazardous for disposal purposes.

Monitoring costs are based on the assumption that sampling is conducted at five shallow zone wells and three intermediate zone wells, with one quality control sample in each zone. In the shallow zone, monitoring begins 6 months into Year 2 when groundwater extraction ends and MNA begins. The sampling frequency is quarterly for 2 years, then semiannually for 3 years, then annually for Years 7 through 10, and finally every 5 years (Years 15, 20, 25, and 30). Analysis of the shallow zone groundwater is for VOCs and perchlorate. In the intermediate zone, monitoring begins at the start of Year 1 when MNA begins. The sampling frequency is quarterly for 2 years (Years 1 and 2), then semiannually for 3 years (Years 3 through 5), then annually for Years 6 through 10, and finally every 5 years (Years 15, 20, 25, and 30). Analysis of the intermediate zone groundwater is for VOCs.

The discount rate of 2.8% is based on the Office of Management and Budget Circular No. A-94, January 2008.

The information in this cost estimate summary table is based on the best available information regarding the anticipated scope of the remedial alternative. Changes in the cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. Changes will be documented in accordance with 40 CFR 300.435(c)(2) in the form of a memorandum in the Administrative Record, an Explanation of Significant Difference (ESD), or a ROD amendment, as necessary. This is an order-of-magnitude engineering cost estimate that is expected to be within +50 to -30 percent of the actual project cost.

Changes will be documented in accordance with 40 CFR 300.435(c)(2) in the form of a memorandum in the Administrative Record, an Explanation of Significant Difference (ESD), or a ROD amendment, as necessary. This is an order-of-magnitude engineering cost estimate that is expected to be within +50 to -30 percent of the actual project cost.

Table 2-14. Description of ARARs for Selected Remedy

Citation	Activity or Prerequisite/Status	Requirement
Soil		
TCEQ Texas Risk Reduction Rules 30 TAC 335.558 and 30 TAC 335.559(g)(2)	Ensures adequate protection of human health and the environment from potential exposure to contaminants associated with releases – **relevant and appropriate** for remediation of contaminated soil and contaminated pipeline solid residue for cross-media contamination pathways such as soil to groundwater and for hypothetical future maintenance workers.	Non-residential (industrial) soils shall conform to the non-residential soil-to-groundwater cross media protection concentration. Non-residential (industrial) soils shall conform to the non-residential soil-to-groundwater cross media protection concentration MSC (GWP-Ind) values for 2,4,6-TNT for soils less than 3 ft bgs and for soils deeper than 3 ft bgs; 2,4-DNT and 2,6-DNT and Perchlorate in accordance with 30 TAC 335.559(g)(2) and as listed in **Table 2-10** of this report. The concentration of contamination in soil and pipeline solid residue shall not exceed the non-residential soil-to-groundwater protection MSC (GWP-Ind) for the COCs listed in **Table 2-10.** COCs in soil and pipeline solid residue COCs include 2,4,6-TNT, 2,4-DNT, 2,6-DNT, 1,3-DNB, 2-amino-4.6-DNT and 4-amino-2,6-DNT.
Groundwater		
Federal Safe Drinking Water Act (SDWA) MCLs 40 C. F. R. §§ 141.61 and 141.62	Applicable to drinking water for a public water system**—relevant and appropriate** for water that could potentially be used for human consumption.	Must not exceed SDWA MCLs for water designated as a current or potential source of drinking water. The MCLs for organic contaminants TCE, MC, 1,2-DCE, 1,2-DCA; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; and VC are provided in 40 C. F. R. § 141.61(a) and the MCLs for inorganic contaminants arsenic; mercury; and, selenium are provided in 40 C. F. R. § 141.62 (b) and **Table 2-10** of this report.
General Site Preparation, Construction, and Excavation Activities		
Opacity Standard 30 TAC 111.111(a)(8)(A)	Fugitive emissions from land-disturbing activities (e.g., excavation, construction)**—applicable**.	Visible emissions shall not be permitted to exceed opacity of 30% for any 6-minute period from any source.
Air Contaminants – General Nuisance Rules **30 TAC 101.4**	Emissions of air contaminants**—applicable**.	No person shall discharge from any source whatsoever one or more air contaminants or combinations thereof, to exceed an opacity of 30 percent for any 6-minute period as are or may tend to be injurious to or to adversely affect human health or welfare, animal life, vegetation, or property, or as to interfere with the normal use and enjoyment of animal life, vegetation, or property.
Fugitive Particulate Matter Standard 30 TAC 111.145	Fugitive emissions from land-disturbing activities (e.g., excavation, construction)**—applicable**.	No person may cause, suffer, allow, or permit a structure, road, street, alley or parking area to be constructed, altered, repaired, or demolished, or land to be cleared without taking at least the following precautions to achieve control of dust emissions: • Use of water or of suitable oil or chemicals for control of dust in the demolition of structures, in construction operations, in work performed on a road, street, alley, or parking area, or in the clearing of land; and • Use of adequate methods to prevent airborne particulate matter during sandblasting of structures or similar operations
Storm Water Runoff Controls 40 C.F.R. § 122.26	Storm water discharges associated with construction activities**—applicable** to disturbances of equal to or greater than 1 acre of land.	Specific to areas of excavation of contaminated soil. Good construction management techniques, phasing of construction projects, minimal clearing, and sediment, erosion, structural, and vegetative controls shall be implemented to mitigate storm water run-on/runoff.

Table 2-14. Description of ARARs for Selected Remedy (continued)

Citation	Activity or Prerequisite/Status	Requirement
Waste Generation, Management, and Storage		
Characterization of Solid Waste 40 C.F.R. § 262.11 30 TAC 335.62 30 TAC 335.504 30 TAC 335.503(a)(4)	Generation of solid waste, as defined in 30 TAC 335.1—**applicable**.	Must determine whether the generated solid waste is RCRA hazardous waste by using prescribed testing methods or applying generator knowledge based on information regarding material or process used. If the waste is determined to be hazardous, it must be managed in accordance with 40 C. F. R. § 262–268. After making the hazardous waste determination as required, if the waste is determined to be nonhazardous, the generator shall then classify the waste as Class 1, Class 2, or Class 3 (as defined in Section 335.505 through Section 335.507) using one or more of the methods listed in Section 335.503(a)(4) and Section 335.508 and manage the waste in accordance with the requirements of Chapter 335 of the TAC for industrial solid waste.
Characterization of Hazardous Waste 40 C.F.R. §.264.13(a)(1); 40 C.F.R. § 268.7 30 TAC 335.504(3) 30 TAC 335.509 30 TAC 335.511	Generation of a RCRA hazardous waste for treatment, storage, or disposal—**applicable** if hazardous waste is generated (e.g., PPE).	Must obtain a detailed chemical and physical analysis of a representative sample of the waste(s) that at a minimum contains all the information that must be known to treat, store, or dispose of the waste in accordance with 40 C. F. R. §264 and 268. Must also determine whether the waste is restricted from land disposal under 40 C. F. R. § 268 et seq. by testing in accordance with prescribed methods or use of generator knowledge of waste.
Requirements for Temporary Storage of Hazardous Waste in Accumulation Areas 40 C. F. R. § 262.34(a) and (c)(1) 30 TAC 335.69(a) and (d)	On-site accumulation of 55 gallons or less of RCRA hazardous waste for 90 days or less at or near the point of generation—**applicable** if hazardous waste is generated (e.g., PPE) and stored in an accumulation area.	Remedial activities derived waste (from monitoring and treating contaminated groundwater) is expected for this facility. A generator may accumulate hazardous waste at the facility provided that • Waste is placed in containers that comply with 40 C. F. R. § 264.171 to 264.173 (Subpart I); and • Container is marked with the words “hazardous waste”; or • Container may be marked with other words that identify the contents.
Requirements for the Use and Management of Containers 40 C. F. R. § 264.171–264.173 30 TAC 335.69(e) 30 TAC 335.152(a)(7)	On-site storage/treatment of RCRA hazardous waste in containers for greater than 90 days—**applicable** if hazardous waste is generated (e.g., PPE) and is stored in containers.	Design and operating standards of 40 C. F. R. § 264.175(c) and 40 C. F. R. § 264.171, §.264.172, and §.264.173(a) and (b) must be met for the use and management of hazardous waste in containers.
Wells		
Well Construction Standards—Monitoring or Injection Wells 16 TAC 76.1000	Construction of water wells—**applicable** to construction of new monitoring or injection wells, if needed.	Injection wells shall be completed in accordance with the technical requirements of Section 76.1000, as appropriate. Substantive requirements applicable to the injection wells will be adhered to.

Table 2-14. Description of ARARs for Selected Remedy (continued)

Citation	Activity or Prerequisite/Status	Requirement
Wells (continued)		
Class V Injection Wells 30 TAC §331.9(a); 30 TAC §331.10(a); 30 TAC §331.10(d); 30 TAC §331.21; 30 TAC §331.132(a); 30 TAC §331.132(c); 30 TAC §331.132(d)(1); 30 TAC §331.132(d)(4); 30 TAC §331.133(e)	Installation, operation, and closure of injection wells for in situ chemical oxidation fall in the category of Class V Injection Wells— **relevant and appropriate**.	Injection wells shall be constructed to the required specifications for isolation casing, surface completion, prevention of commingling, and confinement of undesirable groundwater to its zone of origin. Closure shall be accomplished by removing all of the removable casing and the entire well shall be pressure filled via a tremie pipe with cement from bottom to the land surface, or closure shall be performed by the alternative method for Class V Wells completed in zones of undesirable groundwater. Groundwater concentrations at time of well closure will determine the appropriate method of abandonment. Substantive requirements applicable to the injection wells will be adhered to.
Well Construction Standards—Extraction Wells 16 TAC 76.1000(a) and (c) through (h) 16 TAC 76.1002(a) through (c) 16 TAC 76.1008(a) through (c)	Construction of water wells**—applicable** to construction of extraction (recovery) wells.	Substantive requirements applicable to extraction (recovery) wells will be adhered to. Wells shall be completed in accordance with the technical requirements of Section 76.1000, as appropriate. Water wells completed to produce undesirable water shall be cased to prevent the mixing of water or constituent zones. The annular space between the casing and the wall of the borehole shall be pressure grouted with cement or bentonite grout to the land surface. Bentonite grout may not be used if a water zone contains chloride water above 1500 parts per million (ppm) or if hydrocarbons are present. Wells producing undesirable water or constituents shall be completed in such a manner that will not allow undesirable fluids to flow onto the land surface. During installation of a water well pump, installer shall make a reasonable effort to maintain integrity of groundwater and to prevent contamination by elevating the pump column and fittings, or by other means suitable under the circumstances. Pump shall be constructed so that no unprotected openings into the interior of the pump or well casing exist.
Treatment/Disposal		
Disposal of Wastewater (e.g., contaminated groundwater, dewatering fluids, decontamination liquids) 40 C. F. R. § 268.1(c)(4)(i) 30 TAC 335.431(c)	RCRA-restricted characteristically hazardous waste intended for disposal**—applicable** if extracted groundwater is determined to be RCRA characteristically hazardous.	Appropriate and relevant in the event of a spill. Disposal is not prohibited if such wastes are managed in a treatment system subject to regulation under Section 402 of the CWA that subsequently discharges to waters of the United States.
Closure		

Table 2-14. Description of ARARs for Selected Remedy (continued)

Citation	Activity or Prerequisite/Status	Requirement
Standards for Plugging Wells that Penetrate Undesirable Water or Constituent Zones 16 TAC 76.1004(a) through (c)	Plugging and abandonment of wells**—applicable** to plugging and closure of monitoring and/or extraction wells.	If a well is abandoned, all removable casing shall be removed and the entire well pressure filled via a tremie pipe with cement from bottom up to the land surface. In lieu of this procedure, the well shall be pressure-filled via a tremie tube with bentonite grout of a minimum 9.1 lb/gal weight followed by a cement plug extending from land surface to a depth of not less than 2 feet. Undesirable water or constituents or the freshwater zone(s) shall be isolated with cement plugs.

NOTES:
This figure shows only sample concentrations that exceeded MSCs except soil boring data; all detections were included for the soil boring data.
Data associated with the green highlighted locations was collected during the Phase I and II RFI's and USEPA determined the data are not valid for environmental decision making.
Abbreviations:
bgs – below ground surface
COC – contaminant of concern
DNT - Dinitrotoluene
ft – feet
GWP-Ind – soil MSC for industrial use based on groundwater protection
J – The analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed.
JL - The analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed. Result may be biased low.
JH - The analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed. Result may be biased high.
mg/kg – milligrams per kilogram
MSC – medium-specific concentration
N – north
NA – not applicable
S - south
SAI-Ind – soil MSC for industrial use based on inhalation, ingestion and dermal contact.
TNT - Trinitrotoluene
µg/L - microgram per liter

3. Responsiveness Summary

The Responsiveness Summary serves three purposes. First, it provides the U.S. Army, USEPA, and TCEQ with information about community concerns with the preferred alternative at LHAAP-29 as presented in the Revised Proposed Plan. Second, it shows how the public's comments were considered in the decision-making process for selection of the remedy. Third, it provides a formal mechanism for the U.S. Army to respond to public comments. Two public comment periods and public meetings were held, one for the LHAAP-29 PP and one for the Revised PP. Responsiveness summaries for both meetings are provided.

The U.S. Army, USEPA, and TCEQ provide information regarding LHAAP-29 through public meetings, the Administrative Record for the facility, and announcements published in the Shreveport Times and Marshall News Messenger newspapers. **Section 2.3** discusses community participation on LHAAP-29, including the dates for the public comment period, the date, location, and time of the public meetings, and the location of the Administrative Record. The following documents related to community involvement were added to the Administrative Record for the two comment periods and public meetings:

- Transcript of the public meeting held on March 22, 2011
- Presentation slides from the March 22, 2011 public meeting
- Written questions and comments from the public during the public comment period pertinent to the revised PP, and the U.S. Army response to those comments are provided in **Section 3.1**.
- Transcript of the public meeting held for the Revised Proposed Plan on December 6, 2018
- Presentation slides from the December 6, 2018 public meeting
- Verbal questions and comments (no written questions provided) from the public during the public comment period, and the U.S. Army response to those comments are provided in **Section 3.1**.

3.1 Stakeholder Issues and Lead Agency Responses

This section responds to significant issues raised by stakeholders including the public and community groups that were received in written or verbal form.

2018 Revised Proposed Plan Comments

No written comments were received on the Revised Proposed Plan. Verbal comments and questions were discussed and addressed during the public meeting on December 6, 2018 and are summarized below.

Question/comment: Will the contaminated soil remain at the site?

Response: The estimated 3,900 cubic yards of contaminated soil will be excavated and disposed at a permitted landfill. The Landfill will be selected as part of the remedial design process.

Question/comment: Are they going to fill in the excavation areas?

Response: *What is typically done in these situations is to backfill with clean soil and re-vegetate the area. The specific details will be developed as part of the remedial design, which hasn't happened yet.*

Question/comment: The information presented states the wooden wastewater line has been flushed and abandoned. I would think the wood has rotted by now. Does it still exist, and is there anything more to be done there?

Response: *As part of the Remedial Design, the soil along the wooden TNT wastewater lines will be sampled to confirm that leaching from the lines has not occurred. Results from the confirmation soil sampling may identify additional areas exceeding the cleanup levels, which would require soil excavation and disposal. Additionally, as part of the Remedial Design, the deteriorated wooden wastewater line will be sampled to determine whether contaminants in the line exceed soil cleanup levels and require excavation and disposal.*

Question/comment: Does the cooling water line made of clay still exist? Has it been flushed?

Response: *Yes, the clay line will be flushed and the water sampled.*

Question/comment: I guess they're expecting that there could be some holes in that old clay pipe, so they're going to check it with a camera. And if they see a hole, then they'll check the soil around where that hole was. Because I'm wondering how aren't these falling apart and disintegrated over time.

Response: *The lines haven't disintegrated. They will be flushed and inspected, and if any breaks are found, soil in the vicinity will be sampled to determine if contaminants have leached into the soil.*

Question/comment: There was a process where they were trying microorganisims out in the area near the fire station about three or four years ago. Did that prove to be successful in any way?

Response: *We've performed a treatability study at the old Chemlab. It's different than what we are doing now. We do enhanced bioremediation at two areas, and will begin in a third area soon. We've had good success with this process in these areas. The treatability study at Site 37 was not successful. That bioremediation at LHAAP-37 was aerobic as opposed to anaerobic process, which has been used at the other three plumes. For Site 29, the contaminant is methylene chloride, which is almost at the DNAPL phase (that is a separate phase and not dissolved in groundwater). The concentrations are so high that it is toxic to the microorganisms and they can't degrade the methylene chloride. They can survive around the edges of the plume but not in the main portion. The data and posters provided show that concentrations decrease rapidly as you get further from the center of the plume where the DNAPL is present and indicates that degradation is probably occurring.*

One thing to note about the shallow and intermediate plumes at Site 29 is that they appear to be stable and not migrating due to the geology. The contaminant plumes appear to be contained by clay lenses. This is fairly unusual but in this case is helpful.

Question/comment: *In heating up the ground that deep is that going to harm the animals or vegetation?*

Response: *We don't expect the soil at or near the ground surface to be heated up to temperatures that could harm animals or vegetation. The heating will occur in the subsurface in the contaminated zone at 45 feet below ground surface. The heater wells or electrodes will be placed at that depth so that only the main part of the plume will be targeted to be heated to the highest temperatures (up to 140 degrees F). There will be a halo of warmed up soil and groundwater around the primary area though. That is considered possibly beneficial to help with destruction of VOCs in the shallower groundwater zone, but we're not sure just how much that might happen or the extent of the warming to shallower depths.*

Question/comment: Are we going to see clearing of that land and taking trees and dirt and everything out for these heating wells?

Response: *Much of the surface area was cleared of low-growing vegetation for the previous investigations and well installation. Some regrowth has occurred and there will have to be some vegetation or tree removal in specific areas that will be excavated, for well installation, and equipment access. That will need to be determined during the remedial design phase. We will try to minimize the amount of environmental damage. We were discussing how to do the work with minimal impact with the regulators and USFWS but we still have to balance that with the need to remove the contamination.*

Question/comment: Are you going to protect this area using fencing or other means?

Response: *During remedial activities, there will be an exclusion zone established to keep people out for safety reasons. One of the gates might need to be closed for a time while there is work going on.*

Question/comment: Is thermal desorption new, is it a proven practice?

Response: *This technology has been around for five to ten years. Because we have DNAPL at depth and there aren't many options to clean it up, we're anticipating that this approach will be able to vaporize the DNAPL so we can remove it.*

Question/comment: Earlier you mentioned that deep groundwater, beyond 88 feet is not contaminated, that this DNAPL is in the intermediate zone?

Response: *That is correct. There are monitoring wells in the deep zone that confirm the contamination does not extend to that zone.*

Question/comment: Once the decision has been made, will you go out with another contractor or will this company be the one to do the work?

Response: *We will have a separate remedial design and potentially a separate remedial action contract.*

Question/comment: This contamination has been here so long, hasn't the damage been done? Is the fear of migrating what is urging us to want to remove it completely? Not a lot has been damaged so why are we doing all this and planning to spend millions of dollars for this?

Response: *At other sites there is a visible risk to surface water. At this site the DNAPL in the intermediate groundwater is actually considered a principal threat waste because it will continue to*

contaminate groundwater. The EPA regulations require that a principal threat waste must be remediated. In addition, even though the plumes aren't moving, there are Federal and State of Texas regulatory requirement to return groundwater to beneficial uses whether we're using it or not, so remedial action is still required. Before 2009 if the groundwater wasn't being used you could let it go, but EPA's rules changed with regard to groundwater and now it is required to return all groundwater to its beneficial use. We have a small area of soil that is an ecological risk that must be remediated.

Question/comment: You've said you don't know what future uses [of groundwater] might be and that scares me. We went through a long process for this to become a refuge and now you're saying there is an opportunity for someone to come in and take the property and use it for another use?

Response: *That is not the intent at all. There are only two ways the property could come out of refuge property, a congressional act or some type of transfer to another federal agency. There is very limited potential for this to happen and is not anticipated. Everything that's being done has the anticipated use as a refuge and the regulatory requirement with regard to returning groundwater to beneficial uses is the driver for the remedial action planning. There are sites throughout the nation where this is required so Longhorn is not being required to do more than other sites.*

Question/comment: The Caddo Lake Institute has a third party contaminant expert who reviews these documents and he finds this to be a good plan. His largest question is the depth and extent of the DNAPL and that has been answered. I wanted to share with the community that he found this to be a good plan.

Response: *Thank You*

2011 Proposed Plan Comments

Question/comment: Remedial Alternatives 2 and 3 includes Excavation and Offsite Disposal of Soil, but no amount is given. How many acres within site 29 are we talking about? How deep would the excavation go? How many cubic yards are proposed to be removed from site 29?

Response: *Based on comparison of concentrations versus cleanup levels, several excavation locations are identified to various depths. Confirmation samples will be collected to verify the cleanup levels are met. Excavation will continue until the cleanup levels are attained in both the vertical (floor) and horizontal (walls) directions. Thus, the actual excavation size and depth may vary from the proposed excavations.*

The proposed excavation areas to mitigate human health risk are:

- *Area around 29SD46 – explosives contaminated soil with the approximate dimensions of 120 feet by 20 feet to a depth of 1 foot and an estimated total volume of 90 cubic yards (cy).*
- *Area around 29SB86 – perchlorate contaminated soil with approximate dimensions of 100-foot diameter circle to a depth of 10 feet and an estimated volume of approximately 2,900 cy.*

The proposed excavation areas to mitigate ecological risk by removal of explosives contaminated soil are:

- *Area around 29SB08 (former Building 802-A) – approximate dimensions of a 60-foot diameter circular area and an estimated volume of approximately 200 cy.*
- *Area around 29DLineWHW01 – stained soil around former Building 806-D and former Building 806-A, with an estimated volume of approximately 30 cy.*
- *Area around 29SD13, 29SB15, and GPS-12 (cooling water ditch north of Avenue D), 150 feet by 20 feet, approximately 440 cy.*

In total, the areas are less than a half-acre with a volume of approximately 3,900 cy.

Question/comment: It is a poor plan for the Army to waste money flushing and plugging the old TNT wastewater, and cooling water lines at site 29 in hope it removes the dangerous chemicals contaminating the groundwater. This is not a cure for the problem. Given the high concentration levels of dangerous chemicals listed, these lines should be dug up and disposed of. Any contaminated soil adjacent to the lines caused by leakage from the lines should be dug up as well and disposed of. By doing this, it for sure resolves the problem by preventing further contamination to groundwater.

Response: *The contamination in the lines has the potential to cause contamination in the groundwater only if there is no action and the contamination remains in the lines and the line deteriorates to allow water to infiltrate or the contamination to come into contact with the soil. Currently, there is no evidence that the explosive residue in the lines has caused the isolated shallow explosive groundwater plumes, as they are not located adjacent to the lines. Explosive soil contamination that poses a potential to leach into the groundwater was identified in the surface soil. (These areas are proposed for excavation as described in the previous response.) The samples collected from the subsurface soil adjacent to the TNT wastewater lines do not have explosive concentrations exceeding the groundwater protection standard, or do not indicate contamination that poses a potential to leach into the groundwater.*

Additionally, as part of the RD, confirmation soil samples will be collected adjacent to the North and South Cooling Water lines as well as the TNT wastewater lines to confirm that leaching from the lines has not occurred.

Over time, the lines may eventually deteriorate or break down. After line flushing, no contamination (no solid or liquid residue) will remain in the lines; therefore, there will be no groundwater infiltration and transport of contaminants as the lines deteriorate. The lines will remain buried below ground and since the lines do not contain any liquid or soil residue, they cannot leak and cannot be a conduit for contaminating the surrounding soil or groundwater from past operations at the site.

Question/comment: Several comments have been received regarding the mitigation of the TNT transite process wastewater line and the two cooling water lines (North and South) as follows:

- All Lines –
    - What is the procedure to plug the lines? Plugging the inlets and outlets to prevent water from infiltrating and transporting may not be correct because the lines may develop leaks, as the seals will eventually fail.

  - What is the length of the lines, diameter, how deep they are buried, and about how much it would cost to remove or excavate and dispose of the lines off site?

- TNT process wastewater line – How will it be determined whether high concentrations of contaminants remain in the TNT wastewater line after it is flushed? How will lines be sampled if not accessible by a manhole?
- Cooling water lines –
  - For the RD evaluation only two locations along the northern cooling water line will be sampled. This is not sufficient to characterize contamination along the entire northern line. High concentrations of contaminants have been found at other locations along the northern line. Most of the line has not been sampled because it is not accessible through manholes.
  - The southern cooling water line will not be sampled for the RD evaluation even though high concentrations of contaminants have been found in the line. As with the northern line, most of the southern line has not been sampled because it is not accessible through manholes.
  - If the cooling water lines are flushed, the Army has not explained how it will determine whether high concentrations of contaminants remain in the lines after flushing.

Response: *To clearly describe the lines and the approach to the selected remedy, it must be understood that there are two distinctly different processes that generated the liquid flowing through these lines and remaining residue. Thus, a discussion of each line to address the above comments is presented below:*

TNT Process Wastewater Line – The TNT wastewater line carried away process wastewater from the washing process during TNT production (also known as "red water, yellow water, red liquor and yellow liquor"). The TNT wastewater line carried wash water from the process and is expected to have some solids in it (5 to 15%). The wastewater was pumped and treated at the wastewater treatment plant (LHAAP-32). This line was originally installed as a wooden line before the transite line was installed. Historical documentation (Bate Stamp 001446, RCRA FA, April 1988) indicated a wooden TNT line (a.k.a. red water line) was used for a short time before the transite line was put into service. The wooden line was "clear-flushed" in 1946 and abandoned. It was determined that no further action was necessary for this line (Bate Stamp 001446). During investigation activities, the wooden TNT wastewater line was found 5 feet south of the transite TNT process wastewater line. The wooden line was cut to allow sampling of the contents. Although the sample results indicated the presence of explosives, the data was later determined by EPA to be unsuitable for environmental decision-making. Because the line is deteriorated and has been cut in multiple locations, the line cannot be flushed. Instead, the line contents and surrounding soil will be sampled and then excavated and disposed offsite if required.

The TNT transite process wastewater line is approximately 3 feet bgs. The gravity flow portion of the line is approximately 3,000 linear feet. The pressurized portion of the line is approximately 500 linear feet, and the lines are in good condition. The diameter of the TNT transite process wastewater line along the entire line is not known but should range from 8 inches to 18 inches based on the original

design of the wooden stave line. There are no manholes in the transite line, and the line will be cut at select locations for any additional sampling and the implementation of the remedy.

For the investigation, the gravity fed portion of the line was cut at two locations and a thick viscous residue was observed. Samples were collected at these two locations. Samples were also collected at two points along the pressurized portion of the line that extends from the former pump house location to LHAAP-32, located north of LHAAP-29. Since explosives were identified in the viscous residue in the gravity fed portion of the line, it is assumed that this residue remains throughout the line and the samples were representative.

Thus, the selected remedy is to flush the line with potable water. The exact procedure will be developed in the RD, but generally the flushing will be conducted in segments since the line was broken during the investigation phase and the line is no longer a single continual run of pipe. Visual verification that the residue is not sticking to the sides of the pipe will also be conducted. The flush water will be containerized, sampled for waste characterization, and properly treated or disposed. Flushing will ensure that no residual material is left in the lines. Thus, even if the pipes break in the future, there is no contamination remaining to leach. After flushing, the inlets and outlets of the TNT wastewater line will be plugged with a bentonite slurry mix or cementitous grout to stop future infiltration. The procedures for the plugging activities will be included in the RD.

The transite TNT wastewater line is a combination of cement and asbestos that, when disturbed, can become friable and pose additional risk. Exposure to friable asbestos requires special handling and disposal requirements, increasing risks to workers through exposure by the process of digging the lines out of the ground (causing the material to become friable), handling the pieces onsite and during the subsequent transportation and disposal. The location of the line remaining in place will be surveyed and filed with the County. Since the TNT wastewater line is asbestos, the county notification will provide information on the existence and location of the transite line in order to avoid disturbing the line in the event future excavation or other activities are being planned in the area. Additionally, the depth of the line is deeper than the 2 feet bgs, the depth used for industrial use. Since no residue would remain in the lines after flushing, no contamination would remain in the line or have the potential to contaminate the surrounding soil or groundwater even if the line would deteriorate. Additionally, the removal of the line will impact a large area of the site that is currently covered with mature trees and native vegetation.

<u>Cooling Water Lines</u> – The TNT manufacturing process generated a lot of heat; cold water was used to cool the reaction equipment. It flowed over the equipment and down a drain into the cooling water drain lines. Thus, the cooling water lines carried water and would not have carried solids. There were two lines, the North and South Cooling Water (a.k.a. blue cooling water lines) lines, that were gravity fed lines constructed of vitrified clay pipe with manholes. The cooling water from six production plants flowed into the two main collection lines (North and South). The main cooling water lines are approximately 5,000 feet, with approximately 280 feet of smaller line at each of the six production plants. The lines are approximately 8 feet bgs and range from 8 to 18 inches in diameter. The lines drain into a ditch along 16th Street which eventually flows into Goose Prairie Creek.

Small amounts of solid sediment residue and water were found during the investigations of the pipeline. Samples collected from some of the manholes detected explosives in both the solid residue and water at concentrations above the cleanup levels. These lines only carried water, and the solids found in the manholes during investigations are expected to be from open inlets after demolition of

the facility and through the open manholes. The manholes are low spots in the lines where several lines intersect and solid residue would collect at these locations. It stands to reason that minimal solid residue is expected to be found in the actual lines between the manholes. An attempt will be made to collect additional solid residue samples from the manholes during the remedial action.

For the selected remedy, each manhole and outlet will be inspected prior to flushing. The exact procedure will be developed in the RD, but generally the flushing will be conducted between two manholes. The rinsate water will be containerized, transported, sampled, analyzed, and treated at the onsite groundwater treatment plant or appropriately disposed off-site based on the explosives concentrations. After flushing of the lines, there would be no solid residue remaining in the pipe to conduct additional sampling of the solids; however, the flush water will be tested. Thus, even if the pipes break in the future, there is no contamination remaining to leach. The manholes will then be plugged with a bentonite slurry mix or cement grout. The procedures for the plugging activities will be included in the RD.

Question/comment: The Army claims that "…soil samples collected near the line indicate there has not been a release to the surrounding soil." This is incorrect. Sample collected from soil borings along the line were found to contain TNT, 2-amino-4,6-DNT, and 4-amino-2,6-DNT.

Response: *The commenter is referencing the samples collected near the wooden TNT process wastewater line, which is 3 feet bgs. Soil samples were collected in 2004 near the line 4 to 5 feet bgs to evaluate the potential of contaminants leaching from the line and contaminating the surrounding soil. Table 2-6 from the FS summarizes the detected results. Even though samples were found to contain TNT, 2-amino-4,6-DNT, and 4-amino-1,6-DNT, the concentrations are less than both the SAI-Ind and GWP-Ind. Sampling of the wooden TNT process wastewater line and associated soil will take place during the remedial design phase, and if the results indicate unacceptable levels of explosives are present, excavation and disposal off-site of the material will take place during the remedial action phase.*

Question/comment: *The Army estimates that it will take 90 years for natural attenuation to reduce contaminant concentrations acceptable levels. It is not reasonable to propose a plan that could require the maintenance of LUCs for almost a century.*

Response: *All alternatives evaluated have a long time for restoration. Given the nature of the residual contaminants that are present at LHAAP-29, the length of time that will be required to achieve cleanup levels would be long for any of the remedial alternatives, whether treatment, migration control, or source control by removal. The reasonably anticipated future use of the site is as a national wildlife refuge (i.e. Caddo Lake National Wildlife Refuge). Once the property is transferred into the refuge system, the property must be kept as a National Wildlife Refuge unless there is an act of Congress which removes the parcel or the land is exchanged in accordance with the National Wildlife Refuge System Administration Act of 1966 and the National Wildlife Refuge System Act Amendments of 1974. This proposed transfer as a national wildlife refuge, which by its very nature includes physical access and use restrictions, is subject to control and continual inspection by Refuge personnel. Also, the property is intended to remain under ownership and management of a federal government agency. The LUC will restrict access to the groundwater for purposes other than environmental testing until cleanup levels are met. Additionally, access of groundwater through well installations requires a permit from the Texas Department of Licensing and Regulation or Texas Water District authority. The department will be provided a copy of the county*

recordation that indicates the location of contaminated groundwater at the site and associated restriction.

Question/comment: The extremely high concentration of methylene chloride in the intermediate groundwater zone indicates that DNAPL may by present. If so, it may be very difficult to clean up the groundwater. The Army does not appear to have developed any plans to deal with DNAPL. The Army should explain how it will deal with any DNAPL that may be present.

Response: *The current active remedy to conduct in-situ thermal desorption will reduce contaminant concentrations even if DNAPL is present.*

Question/comment: High concentrations of arsenic, mercury, and selenium exist in the shallow groundwater zone. High concentrations of arsenic exist in the deep groundwater zone. The metals are not subject to natural attenuation by biodegradation and the Army has not explained how they will be cleaned up. The Army should explain how it will cleanup these metals.

Response: *The elevated concentrations of metals were suspected to be a result of sampling methodology and/or turbid samples which could falsely elevate the metals concentration result due to excess solids in the sample. Subsequent sampling and redevelopment of some of the wells resulted in lowered concentrations of some metals.*

The arsenic sample collected from the deep well had high aluminum concentrations; the geochemical relationship between the high aluminum in the same sample as the arsenic indicates arsenic may be naturally occurring. Mercury detections are intermittent and appear to be isolated and the calculated Hazard Index for mercury is less than 1, based on the Final Baseline Human Health and Screening Ecological Risk Assessment for Group 2 Sites, from Jacobs Engineering Corp., 2002.

The extent of arsenic and mercury in groundwater will be assessed site-wide during the remedial design. Selenium was only detected above the MCL in one shallow well and the concentrations have fluctuated over the years. The most recent concentration has an associated adjusted hazard quotient value of 0.15. Selenium will be added as a contaminant of concern.

Question/comment: The current distribution of groundwater contaminants at site 29 is not well known. This is because the Army has not sampled many of the monitor wells (18 of 47) since 2005, and has not sampled any monitor well since 2009. In addition, many of the most recent sample analyses are incomplete. No wells have been analyzed for explosives or perchlorate since February 2007.

The only way to ensure that the current distribution of contaminants is known is to sample all the monitor wells at the site. They should be sample for solvents (e.g., methylene chloride, TCE), explosives (e.g., TNT, 2,4-DNT), metals (e.g., arsenic, mercury), and perchlorate. The Army should do this before it completes the design of the groundwater cleanup plan.

Response: *The analytical suites selected for investigations were based on the past operations that could cause potential contamination at LHAAP-29. Initial investigations had several analytical suites which were reduced to refine the nature and extent of those chemicals that were detected above screening levels. During the remedial design phase, additional data will be gathered to verify plume boundaries, develop monitoring networks, and determine concentrations for the treatment.*

Question/comment: The Army's proposed cleanup plan does not address high concentrations of dangerous chemicals in surface water. The Army should either 1) explain why it is unnecessary to cleanup surface water, or 2) prepare a plan to clean it up.

Response: *The surface water sample collected at 29SW46 has the highest contamination and is located at the cooling water ditch outfall. Both surface water and sediments at this location were sampled and concentrations in the surface water and sediments were above the groundwater MSC for residential use and GWP-Ind levels for explosives, respectively. This location is the outfall of the cooling water lines and is collocated with the high sediment levels which will be removed as part of the selected remedy. The next sample location downgradient of 29SW46 did not show high concentrations of contaminants in the surface water. Thus, the action to remove residual contamination from the cooling water lines (so water cannot infiltrate them and carry contamination into the ditch) and to remove the contaminated sediment where the surface water sample was collected will mitigate impacts to surface water along the cooling water ditch. Also, as part of this action, surface water monitoring will be conducted downgradient of this mitigated area.*

Question/comment: Major components of the cleanup are yet to be determined. These include the evaluation of the cooling water lines, and details of: the plan to monitor metals near the in-situ oxidation area, the soil excavation plan, the groundwater monitoring plan, and MNA implementation. These components will be presented in the RD, which will be completed after the Record of Decision is published. Given the importance these components, the Army should make the RD available for public review and comment as soon as possible.

Response: *The public will be provided with updates on remedial design and remedial action status through the RAB meetings and any concerns can be addressed through this forum. The RAB meetings provide the forum for dissemination of information and discussion. The RD will include performance objectives, schedule and other design criteria and will follow established regulatory guidance for the components of the remedy. The RD will also become part of the Administrative Record and will be available to the public at the Marshall Public Library, the public repository for the LHAAP Administrative Record.*

Question/comment: Recommend expanding environmental testing to include all six isomer of DNT (2,4-DNT, 2,6-DNT, 3,4-DNT, 2,3-DNT, 2,5-DNT and 3,5-DNT), site characterization and evaluation of human health risk should incorporate and consider all six isomers of DNT in all media, and corresponding enforceable remedial goals should be established for the four minor isomers of DNT for soils, sediments, groundwater, and surface water. In the event the presence of minor isomers of DNT is confirmed, there may be potential impacts to aquatic ecosystems that should be addressed.

Response: *The selected remedy will address and monitor the explosive contaminated shallow groundwater and surface water. At this time, there are no Federal or State of Texas promulgated screening levels for DNT isomers, other than for 2,4-DNT and 2,6-DNT. However, as part of the CERCLA process, the statutory five-year reviews will evaluate the effectiveness of the remedy, including any changes in applicable or relevant and appropriate requirements (ARARs) concerning DNT isomers, and would recommend implementation of other measures if needed.*

3.2 Technical and Legal Issues

This section is used to expand on technical and legal issues. However, there are no issues of that nature beyond the technical issues already discussed in **Section 3.1**.

THE UNITED STATES ARMY INVITES PUBLIC COMMENT ON THE REVISED PROPOSED PLAN FOR ENVIRONMENTAL SITE LHAAP-29, FORMER TNT PRODUCTION AREA LONGHORN ARMY AMMUNITION PLANT, TEXAS PUBLIC MEETING ON December 6, 2018 AT THE KARNACK COMMUNITY CENTER, KARNACK, TX

PUBLIC NOTICE

THE UNITED STATES ARMY INVITES PUBLIC COMMENT ON THE REVISED PROPOSED PLAN FOR ENVIRONMENTAL SITE LHAAP-29, FORMER TNT PRODUCTION AREA LONGHORN ARMY AMMUNITION PLANT, TEXAS PUBLIC MEETING ON December 6, 2018 AT THE KARNACK COMMUNITY CENTER, KARNACK, TX

The U.S. Army is the lead agency for environmental response actions at Longhorn Army Ammunition Plant. In partnership with the U.S. Environmental Protection Agency Region 6 (USEPA), the lead Oversight Agency, and Texas Commission on Environmental Quality, the Supporting Agency, the U.S. Army has developed the Revised Proposed Plan for site LHAAP-29, Former TNT Production Area. Although the Revised Proposed Plan identifies the preferred remedy for the site, the U.S. Army welcomes the public's review and comments. Beginning on November 21, 2018, copies of the Revised Proposed Plan and supporting documentation will be available for public review at the Marshall Public Library, 300 S. Alamo, Marshall, Texas, 75670 and on the LHAAP website at http://www.longhornaap.com/LHAAP-29. The public comment period is November 21, 2018, through December 21, 2018. **The public meeting will be held on Thursday, December 6, 2018 at the Karnack Community Center, Karnack, TX beginning at 6:00 PM and ending at 7:30 PM.** The Karnack Community Center is located at Highway 134 and Spur 449 near the front gate of the Caddo Lake National Wildlife Refuge. Questions, comments, and responses on the Revised Proposed Plan will be recorded by a court reporter during the public meeting. Written comments will be accepted throughout the public comment period.

Longhorn Army Ammunition Plant (LHAAP) is an inactive, government-owned, formerly contractor-operated industrial facility located in central-east Texas in the northeastern corner of Harrison County. The installation occupies nearly 8,416 acres between State Highway 43 at Karnack, Texas, and the western shore of Caddo Lake. LHAAP was established in December 1941 near the beginning of World War II for the manufacture of trinitrotoluene. Other past industrial operations at the installation included the production of secondary explosives, rocket motor propellants, and various pyrotechnics. LHAAP was found to have actual and potential releases of hazardous substances or pollutants or contaminants associated with past operations, and it was added to the National Priorities List (NPL) in 1990. LHAAP-29, former TNT Production Area, encompasses approximately 85 acres in the west-central portion of LHAAP. The site was used as a TNT manufacturing facility from October 1942 to August 1945. The facility produced approximately 400 million pounds of flake TNT during its operation using six TNT production lines. Since the end of World War II, the only activity that has been documented to have occurred at LHAAP 29 is the "soak out" or solvent bath of out-of-specification rocket motors. This took place from 1959 to the mid-1970s and involved the use of a methylene chloride-based industrial solvent.

The Revised Proposed Plan for LHAAP-29 addresses contamination in soil, process lines, and groundwater at LHAAP-29. The full list of alternatives evaluated is: 1) No action; 2) Excavation and off-site disposal of soil, flushing and plugging of process lines, monitored natural attenuation (MNA) for shallow groundwater, in situ chemical oxidation followed by MNA for intermediate groundwater, and land use controls (LUCs); 3) Excavation and offsite disposal of soil; flushing and plugging of process lines, groundwater extraction for intermediate groundwater, MNA for shallow groundwater, and LUCs; 4) Excavation and offsite disposal of soil, flushing and plugging of process lines, in situ thermal desorption for intermediate groundwater, MNA for shallow groundwater, and LUCs. Based on available information, the preferred remedy is Alternative 4, which would remove contaminated soil from LHAAP-29 with off-site disposal; flush and plug process lines thereby eliminating potential for contaminants to leach into groundwater; reduce groundwater contamination throughout the intermediate groundwater contaminant plume via in situ thermal desorption and MNA; use MNA for shallow groundwater to assure protection of human health and the environment by documenting that the contaminated groundwater remains localized and contaminant concentrations are being reduced to cleanup levels; and implement LUCs to protect human health by preventing exposure to contaminated media.

PUBLIC NOTICE

THE UNITED STATES ARMY INVITES PUBLIC COMMENT ON THE REVISED PROPOSED PLAN FOR ENVIRONMENTAL SITE LHAAP-29, FORMER TNT PRODUCTION AREA LONGHORN ARMY AMMUNITION PLANT, TEXAS PUBLIC MEETING ON December 6, 2018 AT THE KARNACK COMMUNITY CENTER, KARNACK, TX

The U.S. Army is the lead agency for environmental response actions at Longhorn Army Ammunition Plant. In partnership with the U.S. Environmental Protection Agency Region 6 (USEPA), the lead Oversight Agency, and Texas Commission on Environmental Quality, the Supporting Agency, the U.S. Army has developed the Revised Proposed Plan for site LHAAP-29, Former TNT Production Area. Although the Revised Proposed Plan identifies the preferred remedy for the site, the U.S. Army welcomes the public's review and comments. Beginning on November 21, 2018, copies of the Revised Proposed Plan and supporting documentation will be available for public review at the Marshall Public Library, 300 S. Alamo, Marshall, Texas, 75670 and on the LHAAP website at http://www.longhornaap.com/LHAAP-29. The public comment period is November 21, 2018, through December 21, 2018. The public meeting will be held on Thursday, December 6, 2018 at the Karnack Community Center, Karnack, TX beginning at 6:00 PM and ending at 7:30 PM. The Karnack Community Center is located at Highway 134 and Spur 449 near the front gate of the Caddo Lake National Wildlife Refuge. Questions, comments, and responses on the Revised Proposed Plan will be recorded by a court reporter during the public meeting. Written comments will be accepted throughout the public comment period.

Longhorn Army Ammunition Plant (LHAAP) is an inactive, government--owned, formerly contractor-operated industrial facility located in central-east Texas in the northeastern corner of Harrison County. The installation occupies nearly 8,416 acres between State Highway 43 at Karnack, Texas, and the western shore of Caddo Lake.

LHAAP was established in December 1941 near the beginning of World War II for the manufacture of trinitrotoluene. Other past industrial operations at the installation included the production of secondary explosives, rocket motor propellants, and various pyrotechnics. LHAAP was found to have actual and potential releases of hazardous substances or pollutants or contaminants associated with past operations, and it was added to the National Priorities List (NPL) in 1990. LHAAP-29, former TNT Production Area, encompasses approximately 85 acres in the west--central portion of LHAAP. The site was used as a TNT manufacturing facility from October 1942 to August 1945. The facility produced approximately 400 million pounds of flake TNT during its operation using six TNT production lines. Since the end of World War II, the only activity that has been documented to have occurred at LHAAP 29 is the "soak out" or solvent bath of out-of--specification rocket motors. This took place from 1959 to the mid-1970s and involved the use of a methylene chloride--based industrial solvent.

The Revised Proposed Plan for LHAAP-29 addresses contamination in soil, process lines, and groundwater at LHAAP-29. The full list of alternatives evaluated is: 1) No action; 2) Excavation and off-site disposal of soil, flushing and plugging of process lines, monitored natural attenuation (MNA) for shallow groundwater, in situ chemical oxidation followed by MNA for intermediate groundwater, and land use controls (LUCs); 3) Excavation and offsite disposal of soil; flushing and plugging of process lines, groundwater extraction for intermediate groundwater, MNA for shallow groundwater, and LUCs; 4) Excavation and offsite disposal of soil, flushing and plugging of process lines, in situ thermal desorption for intermediate groundwater, MNA for shallow groundwater, and LUCs. Based on available information, the preferred remedy is Alternative 4, which would remove contaminated soil from LHAAP-29 with off-site disposal; flush and plug process lines thereby eliminating potential for contaminants to leach into groundwater; reduce groundwater contamination throughout the intermediate groundwater contaminant plume via in situ thermal desorption and MNA; use MNA for shallow groundwater to assure protection of human health and the environment by documenting that the contaminated groundwater remains localized and contaminant concentrations are being reduced to cleanup levels; and implement LUCs to protect human health by preventing exposure to contaminated media.
