Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from approp

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi\,x\,Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \; x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi\,x\,Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \; x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BC

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g.,

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95%

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EP

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EE

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi\,x\,Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{n} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAE

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.

Intake Equation:

$$Ej = \left(\frac{A}{HR}\left[\sum_{i=1}^{m}\left(\frac{IRi\,x\,Cij}{BW}\right)\right]\right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{n} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW

Intake Equation:

$$Ej = \left(\frac{A}{HR}\left[\sum_{i=1}^{m}\left(\frac{IRi\,x\,Cij}{BW}\right)\right]\right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR}\left[\sum_{i=1}^{m}\left(\frac{IRi\,x\,Cij}{BW}\right)\right]\right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bio

Aroclors (Aroclor 1242, 1248, 1254, 1260, 1268) EEQ:	2.2E-04	2.9E-05
Phthalates (bis-2ethylhexyl and butylbenzyl) EEQ:	0.0E+00	0.0E+00
Aldrin/Dieldrin/Endrin EEQ:	2.5E-04	2.5E-05

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR}\left[\sum_{i=1}^{m}\left(\frac{IRi\,x\,Cij}{BW}\right)\right]\right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): [n] See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)
Some BAF (or BCF) values based on media regression equations (value in box): n See appropriate text tables for equations.
If BAF/BCF regression equation produced Tier 2 value exceeding maximum Tier 1 BAF/BCF value, Tier 1 value used a default.
LOAEL and NOAEL values from appropriate toxicity summary tables in the text.
UF = Uncertainty Factor for toxicity factor extrapolation, and Adjusted LOAEL or NOAEL = LOAEL/UF or NOAEL/UF
A "0" entry in the exposure concentration column indicates this chemical not selected as a COPEC for this medium.
Receptor diet data and home range data from appropriate text table.
Exposure point concentrations (EPCs) from appropriate text tables.

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \, x \, Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available

Intake Equation:

$$Ej = \left(\frac{A}{HR} \left[\sum_{i=1}^{m} \left(\frac{IRi \times Cij}{BW} \right) \right] \right)$$

Where:
Ej = Total Exposure to Chemical
A = Site Area
HR = Home Range
m = Total number of ingested media
i = counter
IRi = Consumption Rate for Medium
Cij = Chemical concentration (j) in medium (I) (mg/kg or mg/L)
BW = Body Weight

Notes:
Tier 1 = Upper-bound EEQ using 95% UCL, upper-bound BAF/BCF (e.g., 90th percentile), avg food intake rates, avg BW, and min home range.
Tier 2 = EEQ using mean EPC, avg BAF/BCF, avg food intake rate, avg BW, and mean home range.
BAF = Bioaccumulation Factor (may be BCF if this is the only value available)
EED = Estimated Exposure Dose
EEQ = Ecological Effects Quotient.
L = LOAEL based; N = NOAEL based
LOAEL = Lowest Observed Adverse Effect Level
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NOAEL = No Observed Adverse Effect Level
NA = Not applicable/Not available
BAF (or BCF) values from appropriate text tables (BCF = bioconcentration factor)

EXECUTIVE SUMMARY
RODENT SPERM ANALYSIS REPORT NO. 39-DA-0107-04
LONGHORN ARMY AMMUNITION PLANT
KARNACK, TEXAS
JANUARY-FEBRUARY 2004

1. PURPOSE. The purpose of this report is to summarize the findings of the Rodent Sperm Analysis method applied at Longhorn Army Ammunition Plant (LHAAP), Texas in January-February 2004, and thereby supplement LHAAP's Installation-Wide Ecological Risk Assessment.

2. CONCLUSIONS.

2.1 For the Hispid cotton rat (the dominant rodent species present at LHAAP), none of the established sperm parameter thresholds for effect were exceeded at the three study sites. The data are interpreted to mean that reproductive capability is not compromised in maximally exposed terrestrial receptors (small rodents) and by extension in other larger and wider-ranging mammals.

2.2 Corroboration for the finding of successful reproduction in mammals based on sperm parameters is provided by the similarity in total animal captures at the study sites and the reference areas.

2.3 Some Hispid cotton rats at the Plant 2 site were observed to have no sperm. In light of the numerous animal captures, there appears to be no reproductive compromise associated with this observation.

2. AUTHORITY. Statement of Work between Longhorn Army Ammunition Plant (LHAAP), U.S. Army Environmental Center (USAEC) and U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM), 16 July 2003.

3. PURPOSE. To summarize the findings of the Rodent Sperm Analysis (RSA) method applied at LHAAP, Texas in January-February 2004, and thereby supplement LHAAP's Installation-Wide Ecological Risk Assessment (ERA).

4. INTRODUCTION. The conventional approach to terrestrial ERA at hazardous waste sites largely involves the desktop computation of hazard quotients (HQs). HQs are simple ratios of an ecological receptor's estimated chemical intake (in units of mg of chemical ingested/ kg of receptor body weight/day) to either an assumed safe- or effect-level dose of the same chemical, in the same units as the chemical intake. HQs have a number of limitations, primary among them that they are not measures of risk (references 1-3). In light of these limitations and with the intention of supplying more definitive health effects assessment information for several areas of concern at LHAAP, the LHAAP in conjunction with the USAEC, funded the USACHPPM to apply an innovative field-truthing method. Rodent Sperm Analysis is a patent pending method designed to bring ERAs at sites, such as LHAAP to closure, by allowing for as definitive a determination of receptor health as is possible at the present time.

4.1 The RSA method (reference 4) recognizes that at sites such as LHAAP, with contamination that is no less than five decades old, more than ample opportunity has been afforded the site receptors to develop signs of toxicological stress or impact from their onsite exposures (references 5-7). Further, if noteworthy effects should not be apparent in site

receptors at this late date (the anticipated outcome at historically contaminated sites), it can be concluded that any in-place contamination is not of ecological concern. In the event that noteworthy effects are absent, there are only two realistic explanations to offer - critical ecological effects never took hold or effects may have occurred at one time in the past, but with decades having elapsed, full ecological rebounding has come about by the present day.

4.2 The RSA method is designed to work around the ever-present constraint of a very limited list of ecological species available for field collection and sacrifice en route to furnishing quality site assessment information. In addition, the RSA method recognizes the many advantages to working with small rodents, including their being year-round, nonmigratory species, and their having (with minor exception) the greatest degree of direct exposure to soil contaminants of any terrestrial receptor. For all intents and purposes then, RSA evaluates a worse-case exposure scenario for terrestrial receptors.

4.3 RSA is a sensitive testing procedure that borrows from established methods that are applied daily in research and clinical laboratory settings. In short, sperm parameters (such as sperm count) in field-collected rodents are assessed because they are barometers of reproductive success - ERA's preferred toxicological endpoint (see Section 8). Using RSA, if onsite rodents are found to have impaired or compromised reproduction, it is assumed that other site terrestrial receptors are also reproductively compromised. If onsite rodents are not found to be reproductively compromised, it is concluded that other terrestrial receptors are also healthy. Because RSA is able to render a definitive assessment regarding the toxicological endpoint of greatest interest in ERA (something that the conventional HQ-based approach to ERA cannot do), an RSA report never needs to recommend that additional study or monitoring be conducted at a contaminated site. Additionally, other than RSA, at the present time there are no developed field-based methods for those terrestrial receptors that can trigger a remedial action (namely, mammals and birds).

4.4 In RSA, the role of chemical exposure in sperm parameter threshold exceedance is often misunderstood. To the extent that site and reference location are well-matched, differing only in their soil chemistries, observed sperm effects must be due to chemical-in-soil influences (reference 4). It must be remembered, however, that in almost all RSA applications there will be a multitude of chemicals present in the soil, as is the case for the LHAAP sites reviewed in this report. Consequently, ascribing causation to any one chemical or to just a few is quite unreliable given that the toxicology of chemical mixtures is very poorly understood at the present time (references 8 and 9). This inability to ascribe sperm parameter effects to specific chemicals in site soils is not an RSA method shortcoming and does not impact on ERA decision-making for several reasons. First, the anticipated outcome of RSA applications is that sperm parameter exceedances will not be observed due to multiple decades' worth of opportunities for site receptors to adjust to a site's contaminated condition. Further, in the rare event that a threshold is exceeded, best professional judgment will commonly dictate the chemical that is likely to be the most responsible (the risk "driver"). Additionally, where soils are remediated for one specific contaminant, other problematic but less threatening soil chemicals are generally removed as well. It is critical to note here that the RSA method is similar to standard toxicity tests applied in ERA (e.g., earthworm reproduction, plant growth, etc.), in that it is not necessary to know *a priori* that present in the exposure medium (here, soil) is at least one chemical that is

known to trigger the test endpoint. Although RSA does not require the presence in soil of at least one confirmed sperm toxin (reference 4), numerous chemicals that are commonly encountered at hazardous waste sites have been proven to be spermatoxic. A subset of these chemicals, a number of which occur at the LHAAP sites discussed in this report include arsenic, cadmium, chromium, lead, mercury, molybdenum, nickel, 1,3-DNB, 1,3,5-TNB, and 2,4,6-TNT (references 10-25).

4.5 With RSA, as with any experimental approach, it is critical that datasets be well-defined *a priori*. Failure to do so can lead to erroneous results and the reporting of erroneous findings. In the case of RSA, where sperm count has been shown repeatedly to be the sperm parameter to most regularly shift, as well as the sperm parameter that changes the most dramatically (unpublished data), only those adult male rodents that have sperm present are considered when calculating a mean sperm count for either the site or the reference area population. Male animals that have no sperm will not be contributing to population growth, since no fertilizations can result from the matings of these animals with viable females. Averaging zero sperm counts with measured (positive) sperm counts would lead to a biased and grossly underestimated term. The interest then is in computing a representative (specifically an average) sperm count for those animals who are contributing reproductively. It is critical to note here that zero sperm counts (should they occur) and all other noticeable sperm aberrations should always be reported (see paragraph 7.2) and their implications discussed (see paragraphs 8.3 and 8.4).

5. SITE AND STUDY BACKGROUND. LHAAP, located in central-east Texas in the northeastern corner of Harrison County and near the city of Karnack, was established near the beginning of World War II as a TNT manufacturing facility (see Figure B-1). From 1942 to 1945, when the facility was placed on standby status, LHAAP produced 414 million pounds of TNT. LHAAP became reactivated for the Korean War and the Vietnam conflict. For each of these operations, millions of pyrotechnic devices were produced. From the mid-1950s to 1980, LHAAP manufactured 50 million pounds of propellant and 200,000 rocket motors. From 1988 to 1991, LHAAP was used for the static firing and elimination of Pershing I and II rocket motors. LHAAP was placed on the Superfund National Priorities List in 1990.

5.1 Soil, ground water, surface water, and sediments have been contaminated by industrial operations and waste management practices at LHAAP. Further, 18 individual source areas, ranging in size from less than 1 acre to 275 acres, have been defined. Organizationally, for the purposes of facilitating an installation-wide ERA, most of the installation's 8,493 acres have been allocated to three terrestrial sub-areas: the Industrial Sub-Area consisting of 2,330 acres; the Waste Sub-Area consisting of 486 acres; and the Low Impact Sub-Area consisting of 3,217 acres (see Figure B-2).

5.2 For the RSA application at LHAAP, three study sites with bona fide contamination, located in the north-central portion of the Industrial Sub-Area, were selected. These sites were the Plant 2 Area, a Wetland Area, and the Goose Prairie Creek Drainage (GPCD) (see Figure B-2). Plant 2 was selected based on the presence of known contamination and modeled excessive HQs that were of concern. The Wetland Area, located on the eastern boundary of the installation and immediately adjacent to Plant 2, was selected because of its likelihood of being contaminated, given that it receives drainage from Plant 2. The GPCD was selected because this

area takes runoff from a number of contaminated sites and because of the significant degree of expressed stakeholder concern. The RSA method generally requires that a study site have a matched reference area. Where site and reference areas truly match in a number of respects (e.g., soil type, vegetative cover, slope, and local climate), the likelihood is high that there will be at least one common small rodent species occurring at the two properties. Additionally, where a good many features are the same for the two properties, ascribing sperm effects in rodents of the study area (should there be any observed) to chemical-in-soil influences is rather defensible. (This is an isomorphic situation to a well-controlled laboratory toxicity study, where the only difference between the test and control groups is the chemical amendment to the diet of the test group.) Figure B-2 also indicates the location of the reference area of the LHAAP RSA study.

5.3 For Plant 2, a young pine plantation was selected as a reference location to match the pine savannah/scrub habitat of this study site. The reference area for GPCD was the wooded area in the installation's northeast corner. A suitable wetland reference could not be located. An attempt, however, was made to trap small rodents at a location on the installation's eastern boundary (see paragraph 7.5).

6. METHODS. Field-applied RSA intends on trapping 15 adult male rodents of at least one species at both a study site and its matched reference location. (Note: Valid statistical comparisons are still possible with less than this desirable number of captures.) Capturing sufficient adult male rodents is ordinarily achieved by saturating a series of 100 meter by 100 meter grids with baited Sherman live traps. Table C-1 summarizes the specifics of the trapping scheme for the LHAAP RSA study areas.

6.1 Small rodent trapping occurred from 12 January to 1 February 2004. All trapped small rodents were examined for overall health condition; identified to sex, species, and approximate age; and then weighed. All captures other than adult males had a small patch of fur at the back of the neck clipped so that recaptures could be identified. Only adult males were brought to the onsite mobile laboratory for an additional weighing and work-up. The analytical procedures for the sperm parameters followed Tannenbaum et al. (reference 4). As with all RSA applications, the LHAAP field effort assembled information other than the sperm parameter measurements (RSA's primary assessment metrics). This information can be categorized as population- and tissue-based. The former includes total animal captures, relative abundance of animals and species, sex ratios, age distribution, and relative trap success. Tissue-based information includes animal body weights, several organ-to-body weight ratios, and a histological examination for kidney, liver, spleen, and epididymis. The population- and tissue-based information can often be used to corroborate the findings of the sperm parameters assessment.

6.2 It is critical to note that RSA focuses on the biological significance of altered sperm parameters more so than it does on statistical significance of sperm parameter differences or differences in other measures such as body weight. A statistically significant change in a measured parameter can often be wrongly interpreted as signifying a health impact (references 7 and 26). A key advantage of the RSA method is that it is rather precisely known how much of a change (from the reference area condition) in the various sperm parameters of study site rodents is indicative of a reproductively compromised condition. It is equally important to note that metrics other than sperm parameters (e.g., organ-to-body weight ratios), as different as they may

be for study site and reference location, cannot be used to identify stress or impact in site receptors. The metrics other than sperm parameters (the so-called secondary assessment metrics) can only support/corroborate observations regarding the primary assessment metrics. Thus, if there were no sperm parameter exceedances in the small rodents of a study site, but organ-to-body weight ratios appeared significantly shifted in the site rodents, the interpretation would again be that the rodents are not reproductively compromised. The skewed organ-to-body weight ratios, likely caused by one or more site contaminants, would be acknowledged in the reporting, but could not be used to say that there is a health concern in terrestrial site biota. This follows from the fact that there is no way to interpret ratio changes in other than a statistical sense, and the recognition that the ratio changes almost assuredly did not first occur in the site biota at the present time which is some 5 decades after LHAAP contaminant releases began.

7. RSA RESULTS. Beginning with paragraph 7.2, the RSA results are reported by the discrete sites that made up this study. All of the raw RSA data (animal captures, body weights, sperm parameters, organ weights and associated ratios, and histopathology assessment) are included in Appendix D, the contractor's Male Reproductive Assessment Report.

7.1 General. The two dominant small rodent species collected at the sites were the Hispid cotton rat (*Sigmodon hispidus*) and the Cotton mouse (*Peromuscus gossypinus*). [Note that additionally, there were captures of just one or two individuals of Golden mouse (*Ochrotomys nuttalli)* and Marsh rice rat (*Oryzomys palustris*). Thus, these species did not figure into the subject analysis.] Total Hispid cotton rat captures at the three study sites matched and sometimes exceeded that of the reference area, providing an overall indication that the contaminated condition of the study sites is not limiting to this species (see Table C-2). The notably reduced number of specimens with sperm parameter evaluations at two of the three study sites reflects the discovery of many Hispid cotton rats that had an adult appearance (size, weight) but lacked sperm entirely. This phenomenon is discussed further below (see Section 8). Cotton mice were not nearly as numerous as the Hispid cotton rats at the study sites or the reference area (Table C-2), and the sperm parameter comparisons for this species (in Tables C-6 through C-8) therefore, are realistically only reliable for one of the sites. It should be noted that it is a frequent occurrence when conducting RSA, that a comparative sperm parameter analysis is possible for only one (i.e., the dominant) rodent species in the study area region. Regarding organ-to-body weight ratios, almost all of these for the Hispid cotton rat were lower at the various study sites. It is important to note that in the aftermath of having applied RSA approximately ten times to date, no firm trend has emerged with regard to organ-to-body weight ratios. Instances of statistically significant differences between study site and reference area animals are rare, and the direction of sperm parameter change in site animals has not been consistent.

7.2 Plant 2 Site. Two of the 17 male Hispid cotton rats captured had body weights that were less than the lowest body weight of any of the reference area animals and were thus eliminated from further evaluation. Only 4 of the remaining 15 animals had sperm, and in keeping to the tenets of RSA (see paragraph 4.5), only the data of these animals appears in Table C-3. Through histological analysis of the testes, 12 of the 15 animals were determined to be sexually immature although their body mass indicated that they should be adult animals. As Table C-3 shows, the sperm count of Plant 2 Hispid cotton rats is considerably higher (approximately 46% higher) than that of reference area animals. The sperm motility in Plant 2 rats was 2.8% less than that of

reference area rats which is far less than the threshold for effect (see paragraph 8.1). There was virtually no difference in sperm morphology between site and reference area animals which is a common finding wherever RSA has been applied to date (unpublished data). As shown in Table C-8, only the organ-to-body weight ratio for the testes was statistically different (lower) for the Hispid cotton rats at Plant 2 (compared to reference animals). Cotton mice captures were too low at Plant 2 to allow for a valid comparison. Comparative Cotton mice sperm parameter data is reported nevertheless in Table C-6 although the data cannot be considered reliable due to the small sample size.

7.3 Goose Prairie Creek Drainage. Hispid cotton rat captures at GPCD were too low to allow for a valid comparison for any of the metrics. It should be noted however though, that the mean sperm count for the two GPCD adult males was much higher than that of the reference area, and the mean motility for the GPCD animals was also higher (12.6%) than in the reference area animals. Corroboration for these results in Hispid cotton rats (i.e., that they are reproductively capable) derives from the data for Cotton mice at GPCD presented in Table C-7. As shown in this table, there were greater adult male captures at GPCD than there were in the reference area. For these adult males, there was only a 6% decrease in the sperm count, and the sperm motility was actually 5% higher at GPCD than at the reference area. The organ-to-body weight ratios for the Hispid cotton rat at GPCD and the reference area are shown in Table C-9. There were no cases of statistically significant difference. The organ-to-body weight ratios for the Cotton mouse are shown in Table C-10. A legitimate qualitative comparison can be made only for the GPCD; the capture numbers do not permit a valid statistical comparison. As previously mentioned, typically in RSA there is only one small rodent species collected in sufficient numbers to support valid analyses and comparisons. In the case of LHAAP, the Hispid cotton rat was the dominant small rodent species.

7.4 Wetland Area. There were 16 male Hispid cotton rats captured at the Wetland Area. One of these animals was obviously immature and it was eliminated from further evaluation. Of the remaining 15 animals, 3 had no sperm despite having body weights within the range of adults captured at the reference area. The sperm parameters comparison of the remaining 12 males and those captured males at the reference area appears in Table C-5. None of the sperm parameter thresholds (see paragraph 8.1) were exceeded. Moreover, the sperm count of the Hispid cotton rats at the Wetland Area is vastly higher (more than double) than the count of the reference area animals. The sperm motility was reduced by 12.7% which is considerably shy of the threshold for effect (see paragraph 8.1). Only the organ-to-body ratio for kidneys was statistically lower. Cotton mouse sperm parameter comparisons are shown in Table C-8. The reader is reminded that the Cotton mouse was not the dominant small rodent species at the LHAAP sites, and that the sample size (n) is too small to support a valid comparison. Qualitatively, it appears that Cotton mice are not reproductively compromised because sperm count and sperm motility is either the same or better at the site than at the reference area.

7.5 Additional Findings. The small rodent trapping at the wetland parcel, initially intended as a reference location for the Wetland Area, resulted in a serendipitous and potentially useful discovery. Microscopic tissue evaluation revealed that all *Peromyscus sp.* males captured at this site had testicular degeneration. Without additional data we are unable to discuss the significance of this finding.

8. DISCUSSION. One of RSA's principal assumptions is that, if after several decades of exposure to contaminated site media animals do not display evidence of reproductive impact, it is reasonable to anticipate that future reproductive impacts will not arise (reference 4). This principal assumption is built on two other assumptions. First, with rodents generally having the maximum and/or worse-case exposures of terrestrial receptors (principally mammals and birds), if rodent reproduction is proceeding adequately, so too should be the case for other terrestrial receptors (i.e., those that have a decidedly lesser degree of contact with the contaminated terrestrial ecosystem than do rodents, and those that cannot be captured and sacrificed for study). Second, tracking reproduction as the only toxicological endpoint, amounts to a sufficiently rigorous assessment scheme. If reproduction should be proceeding adequately at a historically contaminated site as is anticipated (reference 5), this means that animals are able to live until they are sexually mature, find mates, and go on to produce viable young. Additionally, if a species continues to produce viable young at a historically contaminated site (the case at the LHAAP study sites evaluated in this report), this is reasonably interpreted to mean that no biological function other than reproduction (e.g., behavior, neurology) is being compromised to a level of concern. [If a critical biological function *was* being compromised, animals would not be surviving to the present day.]

8.1 RSA is able to arrive at rather definitive determinations of terrestrial receptor health, because it is known how much of a perturbation in the sperm parameters (count, motility, and morphology; all barometers of reproductive health) is needed for there to be a condition of biological/ecological (here, reproductive) compromise. This is unlike the situation for almost all other biological measurements (references 7 and 26). The literature is replete with references to rodents being robustly fertile (references 27-30). Further, because rodents produce 10-20 times more sperm than is necessary to ensure that adequate reproduction proceeds, as much as an 80-90% sperm count reduction is needed before a claim can be made of impaired reproduction at the population level. In the interest of maintaining conservatism when assessing the reproductive condition of field-collected rodents at contaminated sites, USACHPPM, based on supportive peer-reviewed documentation, elects to apply a 60% sperm count reduction as the "trigger" for possible compromised reproduction. The literature also reports that sperm motility needs to be approximately 40-50% reduced from the control condition (here, the sperm motility of the reference area) in order to claim a case of reproductive impact (reference 9). Sperm morphology (abnormality) appears to be the most sensitive of the three sperm parameters; an increase of only 4% from the "control rate" (i.e., the frequency of abnormal sperm occurring in the background, or in the case of LHAAP, the reference area) is enough to conclude that reproductive compromise is occurring (reference 27). At this juncture, it is critical to appreciate RSA's ability to rely on *biological* significance and not to be misled by findings of statistical significance for certain sperm parameter or organ-to-body weight comparisons. By way of example, if there should be a statistically significant sperm count reduction of 50% at a contaminated site (relative to a matched reference location), although the statistical significance informs that the difference is not due to chance, the finding does not indicate that there is reproductive impact occurring. This finding holds true despite the rather striking absolute difference in the sperm counts. In this context, it is important to appreciate how potentially misleading the commonly applied standard of a 20% change in a measure being interpreted to mean that a harmful effect has set in. The

sperm parameter thresholds listed above help to circumvent the common pitfall in ERA studies of wrongly ascribing "impact" where numerical and statistical differences are found.

8.2 In light of the above, it should be noted that none of the sperm parameter thresholds were exceeded for either rodent species, nor were there any statistically significant differences for these comparisons. Several other sperm parameter measures routinely analyzed with RSA include progressive motility, path velocity, curvilinear velocity, straight-line velocity, and beat cross frequency. Although it has not been established that these parameters are barometers of reproductive success (as are count, motility, and abnormality), the finding that there are no statistically significant differences between group means for these ancillary parameters provides corroboration that the reproductive system of the rodents is not ill-effected at the contaminated sites. It is recognized that Hispid cotton rat captures at the GPCD are insufficient for a valid statistical comparison. Nevertheless, the fact that the sperm count is strikingly higher at the GPCD relative to the reference area, as it was for the Hispid cotton rat at both the Plant 2 and Wetland sites (sites where total species captures were *high*), lends corroboration to the higher sperm count at the GPCD being a real value.

8.3 The strikingly higher mean sperm count at the Plant 2 site compared with its reference area deserves particular attention on several scores. First, with some 11 or more adult males captured at the Plant 2 site that did not have sperm, and despite the uncertainty associated with capturing animals over a brief 2-week window, it is rather evident that a subset of the site population is sustaining the overall population (that appears to number as large as the Hispid cotton rat population of the non-contaminated reference area; see Table C-2). Further, it would appear that there is a compensatory effect operating whereby those adult males that are fertile have a bolstered sperm count to (presumably) ensure that the local population will be perpetuated. This observation demonstrates several key points.

- Had the sperm evaluation not taken place, it would not have been known that there is an effect of sorts (albeit, not a serious one; see further discussion) occurring at Plant 2. Although population dynamics cannot be adequately captured in a 1-2 week field-trapping effort, when capture numbers are roughly the same at a site and its matched reference location, it can be concluded that both areas are capable of adequately supporting a species.

- To have included zeros (i.e., zero sperm count values) in the computation of a mean Plant 2 site sperm count would have amounted to a misrepresentation of the site's reproductive biology. When computing a site's mean sperm count, the intention is to average only the sperm counts of those individuals that have the capability to procreate. The adult male rodents that lack sperm cannot contribute reproductively. It is critical to note that even had the 11 zeros been averaged in with the 4 legitimate sperm counts (of the viable specimens trapped at the Plant 2 site), the 60% sperm count reduction threshold previously described (paragraph 8.1) would then only marginally have been reached.

- Realistically, the sizable percentage of the adult male Hispid cotton rat population at the Plant 2 site that lack sperm have the potential to impact reproduction in a way that

would not otherwise be considered. Since these animals have no sperm to contribute and hence cannot allow for population increase, where they nevertheless copulate with females (assuming that this is occurring), they are limiting opportunities for viable adult males to cause fertilizations to occur, because they are occupying the females' time. Given that the population at the Plant 2 site is not depauperate, this concern is probably not a legitimate one.

• Given LHAAP's multiple-decade history of contamination and considering how many generations of receptors have cycled through the site over this period, it is unrealistic to conclude that sterile adult male Hispid cotton rats first appeared at the P2 site in 2004. It would seem much more reasonable to conclude that the phenomenon of there being sterile males at the site has been around for years and was only discovered because the RSA method evaluates sperm.

8.4 The RSA method is designed to assess the reproductive health of field-exposed animals. It is not RSA's task to explain observed aberrations with regard to the reproductive system, such as the substantial number of Hispid cotton rats at Plant 2 that had no sperm. The paragraphs below address some potential causes for this aberration, although the RSA study at LHAAP concluded that there is no compromised reproduction occurring at the P2 site.

8.4.1 Since Plant 2 and the reference area were trapped in the same 3-week time period, sperm count and the number of adult-sized animals that had no sperm would be expected to be similar. Although the literature describes the phenomenon of seasonal senescent breeding periods in rodents, given that reference area rodents did not display the aberration, seasonality is not considered to be the cause.

8.4.2 Certain mammalian species, including rodents, are known to self-regulate population densities by altering reproductive strategy when it is sensed that the population is too large. This alteration could take the form of delayed time (age) to reproduction (references 31-33). Although definitive determinations of rodent population dynamics require repeated trapping efforts, trapping success of a singular event can provide some indication of the relative rodent population densities for the Plant 2 site and its reference area. It was determined that Hispid cotton rat densities were the same on Plant 2 and the reference area (0.03 animals per trap), and this comparison suggests that there is no overarching need at the Plant 2 site for Hispid cotton rats to invoke density-dependent population control (which could take the form of producing males that have no sperm).

8.4.3 It is known that exposure to a number of chemical classes including dioxins, PCBs, pesticides such as DDT, DDE, and DDD, and certain metals can affect functional reproductive development (reference 30). Many of these environmental contaminants are present at Plant 2. It has also been known that exposure to very low doses of dioxins produces infertility in rodent progeny (references 33-37). It is useful to consider organ-to-body weight ratios when considering chemical exposure as a basis for aberrations of the reproductive system, such as occurred at Plant 2. Differences in such ratios are typically used as indicators of chemical exposure. In the case of the Plant 2 site, the only case of statistically significant difference was for the testes which were smaller than at the reference area. This finding though is more of an

indication of a negative reproductive effect than it is an indication of contaminant exposure. Additionally, the histopathological evaluation found no apparent microscopic changes in the tissues examined that could be linked to possible environmental contaminant exposure.

8.5 Shifted or skewed organ-to-body weight ratios are not known to necessarily indicate health effects in rodents. Further, no apparent trend in the direction of shifts in these ratios has emerged over the previous applications of RSA at contaminated sites. By way of example, it is not a given that the liver/body weight ratio will be higher in site versus reference area rodents. As opposed to the sperm parameter system where the biological/ecological meaning of shifts is known, *statistical* differences are all that can be reported for the organ-to-body weight comparisons. However, there were no statistical differences for any of the computed organ-to-body weight ratios. Finally, a note of caution is worthwhile in this context. Where cases of statistical significance might be found for these ratios, which in turn allow for claiming that rodents at site and reference area represent different populations, it is still not known how much of a difference in ratio is biologically significant (see Appendix D).

9. UNCERTAINTY. As with all aspects of risk assessment, the RSA method has several inherent elements of uncertainty. These are presented in the paragraphs below.

9.1 The RSA method assumes that the well-established sperm parameter thresholds for (reproductive) effect hold true for wild-type rodents as they do for laboratory rodents. Based on RSA's favorable assessment in the peer-reviewed literature, RSA's patent pending status, and the willingness on the part of stakeholders to have RSA conducted at several National Priorities List sites, it would appear that the level of uncertainty here is minor.

9.2 Only one small rodent species provided reliable sperm parameter information to support the subject assessment. Although commonly there is only one species that can be trapped in sufficient numbers to form the basis of a site/reference area comparison, it is possible that the sperm parameter exceedances might have been present had a second or a third species been available. The corroborative animal capture data of the LHAAP study, although only reflecting a "snapshot in time," suggests that other rodent species are not reproductively hampered.

9.3 Based on an extrapolation from the small rodent data, the larger, higher trophic level and wider-ranging mammals at LHAAP are reproductively unharmed. Although resources are unavailable to actually know the status of these larger terrestrial receptors (the ones for whom the rodents serve as surrogates), the assumption/extrapolation is probably valid. The larger mammals have a much lesser degree of site (primarily soil) contact (spatially and temporally) than do the rodents. It should also be noted that in traditional ERA, extrapolations from the laboratory responses of rodents to effects in the larger mammals of a site are routinely made. The RSA generates actual response-to-contaminant data for an affected site, and thus moves a critical step closer to understanding the potential for chemically induced effects to arise at contaminated sites.

10. CONCLUSIONS.

10.1 For the Hispid cotton rat (the dominant rodent species present at LHAAP), none of the established sperm parameter thresholds for effect were exceeded at the three study sites. The data are interpreted to mean that reproductive capability is not compromised in maximally exposed terrestrial receptors (small rodents) and by extension in other larger and wider-ranging mammals.

10.2 Corroboration for the finding of successful reproduction in mammals based on sperm parameters is provided by the similarity in total animal captures at the study sites and the reference areas.

10.3 Some Hispid cotton rats at the Plant 2 site were observed to have no sperm. In light of the numerous animal captures, there appears to be no reproductive compromise associated with this observation.

I. QUALITY ASSURANCE STATEMENT

**REPRODUCTIVE ASSESSMENT OF SMALL RODENTS
LONGHORN ARMY AMMUNITION PLANT (LAAP), MARSHALL, TX
JANUARY 2004**

II. MATERIALS AND METHODS

A. Sample Collection

Oryzomys palustris (Marsh rice rat), *Peromyscus gossypinus* (Cotton mouse), *Sigmodon hispidus* (Hispid cotton rat) and golden mouse, were captured in Sherman live traps from January 14 – 28, 2004. Test areas were identified and described as Plant 2 (P2 – known contaminated site), Wetland (W – wetland site adjacent to P2; potentially contaminated), Goose Prairie (GP – receives drainage from P2; potentially contaminated), Reference (CA – presumed clean) and Wetland Reference (WR – initially presumed clean). Adult male animals were identified and submitted for sperm analysis. All animals submitted for sperm analysis were euthanized with carbon dioxide inhalation and exsanguination. After euthanasia, a terminal body weight for each animal was measured and recorded. For all animals, the abdominal cavity was opened and the reproductive organs exposed. For motility assessment, the epididymis was dissected away from the testis and immediately placed in a petri dish containing 3 mL of a solution consisting of 1% Bovine Serum Albumin dissolved in Phosphate Buffered Saline. The solution was prewarmed to a temperature of approximately 38^{o}C. The epididymis was pierced and a minimum 2-minute period was allowed for the sperm to disperse from the epididymis.

The liver, spleen, kidneys and testes were removed from the body, weighed and preserved in 10% neutral buffered formalin (NBF). The left epididymis was removed and placed on dry ice. The frozen epididymides were transferred to Pathology Associates, A Division of Charles River Laboratories, Inc. and stored frozen at -70^{o}C until evaluation for caudal epididymal sperm count.

B. Sperm Motility Evaluation

Following the dispersal period, a 9 μL sperm sample was obtained from the petri dish and loaded into a 20 μM deep glass chamber (Cell-Vu or Standard Count chamber). The chamber was cover slipped and immediately loaded onto the prewarmed stage of the Hamilton Thorne IVOS automated sperm analyzer. Five fields were automatically selected by the analyzer and each motion image was recorded and stored digitally. The images were subsequently analyzed for percent motility. The percent progressive motility and the sperm motion parameters listed below were also obtained for each animal. The images were permanently stored to optical media.

Motility	The ratio (%) of moving sperm to total sperm present.
Progressive Motility	The ratio (%) of sperm that meet a minimum velocity (75 μM/sec) and a track straightness (45%) criteria to total number of sperm.
Path Velocity (VAP)	Velocity of the average cell path.
Straight-line Velocity (VSL)	Velocity from the beginning of the sperm track to the end of the track.
Curvilinear Velocity (VCL)	Velocity of the actual path (point-to-point).
Beat Cross Frequency (BCF)	The frequency with which the sperm track crosses the sperm path.

C. Total Sperm Count Determination

Each frozen epididymis was removed from the freezer, thawed and the caudal section was trimmed and weighed. The cauda epididymis was homogenized in deionized water and the suspensions were transferred to plastic test tubes and vortexed. A 100 μl sample was transferred to a violet reaction vial containing a Hoechst dye (H33342) which uniquely stains the head of the sperm. A sample of the stained sperm was placed into a 20 μm deep Cell-Vu glass slide which was loaded into the analyzer. Twenty fields were automatically selected by the analyzer for each animal and the number of cauda epididymal sperm determined. The counts reported were adjusted for caudal epididymal weight.

D. Sperm Morphology Evaluation

Two eosin stained slides were prepared for each animal from the epididymis total count preparation. The slides were evaluated and a minimum of 200 sperm cells/animal were examined for morphological development.

E. Tissue Histopathological Evaluation

The preserved tissues (liver, spleen, kidneys and testes) were transferred to PAI, Frederick, MD for processing and evaluation. The tissues were embedded in paraffin, sectioned at approximately five microns, processed to slides stained with hematoxiylin and eosin (H&E), and examined by a veterinary pathologist.

F. Statistical Analyses

Data were analyzed for normality using the Shapiro-Wilk test. The means and standard deviations for the animal body weight data, the organ-to-body weight ratios (as a percent of body weight), the sperm motility and motion data, the total count data and the sperm morphology data were calculated and analyzed by analysis of variance (ANOVA) for all animals and for sexually mature animals (exclusion based upon histopathological findings of immaturity). If a significant effect was seen ($p<0.05$), the Duncan's multiple range test was used for group comparison. Analyses results for groups with less than 2 data points were not reported. Histopathological findings were not statistically analyzed. Statistical analyses were performed using SAS computer programs.

III. RESULTS

A. Body and Organ Weights

Table 1 – 4 (Summary Data)
Appendix A – C (Individual Body and Organ Weight Data)
Appendix D – F (Individual Organ Weight to Body Weight Ratio)

Animal body weight and liver-to-body weight ratio data for the Hispid Cotton Rat (HCR) were not normally distributed when all animals were used. For only sexually mature HCR animals the liver-to-body weight ratio was not normally distributed. The spleen- and testis-to-body weight ratios for the Peromyscus were not normally distributed for data sets, all animals and only sexually mature animals. Normality of distribution was based on the Shapiro-Wilk test.

A statistically significant decrease in the kidney-to-body weight ratio was observed in the

Wetland (W) group compared to both the Reference Area (CA) and Plant 2 (P2) for data sets, all animals and only sexually mature animals. Also, a decrease in the testes-to-body weight ratio was noted in the P2 group compared to the CA group for all animals and only the sexually mature animals. Incidental, though not statistically significant, changes were noted in both data sets, all animals and only sexually mature animals, as an increase in the animal body weight in the Goose Prairie (GP) and Wetland (W) compared to the Reference area (CA), as a decrease in the spleen-to-body weight ratio in the P2 compared to CA, as a decrease in the left epididymis-to-body weight ratio in the GP and P2 compared to CA, and as a decrease in the testes-to-body weight ratio in the GP and W compared to the control. No statistically significant or biologically meaningful differences were noted in the liver-to-body weight ratio for the Hispid Cotton Rat for all animals or for only sexually mature animals compared to the Reference (CA) group. Statistical analyses results for data from the Wetland Reference (WR) area were not reported due to the small sample size (1 animal).

A statistically significant decrease in the testes-to-body weight ratio was noted in the Wetland Reference (WR) compared to the Goose Prairie (GP) group for both Peromyscus data sets, all animals and only sexually mature animals. Also noted for all animals and only sexually mature animals, though not statistically significant, was an increase in the animal body weight for the GP and W areas compared to the Reference (CA) and an increase in the spleen-to-body weight in the GP, W and WR groups compared to the CA. For all animals, an increase in the left epididymis-to-body weight ratio was noted in the GP and W groups compared to CA, while the same parameter was decreased in the WR area compared to the control. When sexually immature animals were excluded, only the WR remained different (decreased) compared to the control. No statistically significant or biologically meaningful differences were noted in the liver-to-body weight or kidneys-to-body weight ratios for the Peromyscus for all animals or for only sexually mature animals compared to the Reference (CA) group. Statistical analyses results for data from the Plant 2 (P2) area were not reported due to the small sample size (1 animal).

B. Sperm Analysis Parameters

Table 5 – 8 (Summary Data)
Appendix G – I (Individual Sperm Motility and Total Count Data)
Appendix J – L (Individual Sperm Morphology Data)

Data for percent motility, percent progressive motility, VAP, VCL, VSL, BCF, epididymal sperm count and percent abnormal sperm (sperm morphology) were not normally distributed for both the Hispid Cotton Rat for all animals and for sexually mature animals. For Peromyscus, the percent motility, percent progressive motility and sperm morphology for all animals and sexually mature animals were not normally distributed. Normality of distribution was based on the Shapiro-Wilk test.

No statistically significant differences were observed between the group means for the sperm analysis parameters examined, including sperm motility, progressive motility, VAP, VCL, VSL, BCF, epididymal sperm count or sperm morphology for both the Hispid Cotton Rat (HCR) and Peromyscus (P) for all animals and for sexually mature animals.

A decrease, though not statistically significant, was noted for all animals and for sexually mature animals in the VAP, VCL and VSL for the W and P2 areas compared to the CA for Hispid Cotton rats. Also noted in all animals and sexually mature animals was a decrease in the BCF for the P2 area compared to the Reference. An incidental increase in the number of sperm per gram of epididymis was noted in the GP, W and P2 areas compared to the CA for all animals and only sexually mature animals. An increase in this parameter is not considered biologically meaningful.

No statistically significant or biologically meaningful differences were noted for the Peromyscus grouped as all animals or only sexually mature for the sperm analysis parameters, including percent motility and progressive motility, VAP, VCL, VSL, BCF, sperm count or sperm morphology.

C. Microscopic Tissue Evaluation

Table 9 and 10 (Summary Data)
Appendix M – N (Individual Organ Microscopic Evaluation Data)

No significant differences in the microscopic findings were noted in the liver, spleen, kidneys and testes of the Hispid Cotton Rat or Peromyscus between the study areas. Incidental, background and/or parasitic findings were noted in the liver and kidneys from each area.

Minimal inflammation and/or hematopoietic cell proliferation is a common background finding in the liver of rodents. Parasitic cysts were noted in livers of 5, 6 and 2 Hispid Cotton Rats (HCR) each in the Reference (CA), Plant 2 (P2) and Wetland (W) areas, respectively. Parasitic cysts were not noted in livers of any Peromyscus. The liver of animal 56 (HCR) in the CA area was characterized by moderate multifocal to coalescing necrosis accompanied by subacute inflammation at the necrotic margins. Capsular fibrin deposits were present in small numbers of animals from most groups. Hair shaft foreign bodies were usually present within the fibrin thrombi but not in every case. It is probable that these lesions resulted from bite wounds and or other means of injury with deposition into the peritoneal space.

Minor variability in splenic size of Hispid Cotton Rats was present and most likely due to sectioning as well as differences related predominantly to white pulp expansion and blood volume. All the spleens were considered within normal limits with respect to the above mentioned changes. Variation in splenic size in groups of Peromyscus resulted from increased extramedullary hematopoiesis in animals 64 and 65. Capsular fibrin deposits were present and occasionally accompanied by mesothelial cell hyperplasia. Similar to the liver, this most likely resulted from injury.

Inflammation and degenerative kidney tubular changes, common in rodents, were present in HCR in both Reference and Impact areas. Similar, changes occurred in the Peromyscus population but the incidence was reduced most likely because of the lower number of samples.

Variability in testicular size was present among rodents in all test areas. Reduction in testicular size appeared to correlate with reduced spermatogenesis, and in the absence of degenerative changes is suggestive of immaturity.

There are no apparent microscopic changes in the tissues examined that can be directly linked to exposure to possible environmental contaminants.

IV. DISCUSSION AND CONCLUSIONS

Statistically significant decreases, possibly related to exposure to environmental contaminants, were noted in the known contaminated site (Plant 2 – P2) for testis-to-body weight ratio, and in the potentially contaminated site, Wetland (W), for kidney-to-body weight ratio for the Hispid Cotton rat (HCR) compared to the Reference control (CA). Other changes that may be the result of exposure to environmental contaminants, although the degree of contamination at the Goose Prairie (GP), Wetland (W) and Wetland Reference (WR) is not known, are an increase in body weight in the GP and W animals, and a decrease in the spleen-to-body weight ratio in the P2 animals, in the left epididymis-to-body weight ratio in the GP and P2 animals, in the testes-to-body weight ratio for the GP and W animals, in the BCF for the P2 animals and decreases in the VAP, VCL and CSL for animals in the W and P2 groups, compared to the control. There were no apparent difference between the GP, W, P2 and WR groups and the reference (CA) for liver-to-body weight ratio, sperm motility, progressive motility, epididymal sperm count and sperm morphology for sexually mature Hispid Cotton rats.

Differences in the Peromyscus data from sexually mature animals, though not statistically significant, were noted between the study groups and the Reference control and may be related to

exposure to environmental contaminants. The animal body weight was increased for the animals in the GP and W areas. The spleen-to-body weight ratio was increased in the GP, W and WR areas, the left epididymis-to-body weight ratio was decreased in the WR area, and the testes-to-body weight ratio was decreased in the W and WR areas, compared to the Reference (CA) area. There were no apparent differences between the GP and W areas compared to the Reference (CA) for the sperm motility, progressive motility, VAP, VCL, VSL, BCF, epididymal sperm count and sperm morphology for sexually mature Peromyscus. There were an insufficient number of animals in the P2 (known contaminated) area for data to be statistically analyzed.
